TITLE  Convention on long-range transboundary air pollution. UN/ECE international co-operative programme on effects on materials, including historic and cultural monuments.  Environmental data report. October 2017 to November 2018	PROJECT LEADER  Terje Grøntoft	NILU PROJECT NO.  O-8208
AUTHOR(S)  Terje Grøntoft and Marta Segura Roux	QUALITY CONTROLLER  Dag Tønnesen	
REPORT PREPARED FOR  Miljødirektoratet Postboks 5672 Sluppen 7485 Trondheim	CONTRACT REF.  2003/1193 713.9	
ABSTRACT  This report presents the ICP Materials database for the period October 2017 - November 2018. It includes environmental data from the ICP Materials trend exposure programme for 2017 - 2018 and, in addition, data for temperature, relative humidity, and precipitation amount back to the end of the previous annual exposure programme in October/November 2015. The database consists of meteorological data (T, RH and precipitation amount) and pollution data, as gas concentrations, amounts of ions in precipitation, particle concentrations and amounts of particle deposition.		
NORWEGIAN TITLE  Konvensjonen om langtransporterte luftforurensinger. UN/ECE internasjonale samarbeidsprogram for materialer og bygd kulturarv. Trendeksponeringsprogrammet 2017 – 2018. Miljødata-rapport. Oktober 2017 til november 2018.		
KEYWORDS  Air quality      Environmental exposure      Material decomposition		
ABSTRACT (in Norwegian)  Denne rapporten presenterer databasen i ICP Materialer for perioden oktober 2017 – november 2018. Den inkluderer miljødata fra ICP Materialer trend-eksponeringsprogrammet for 2017 – 2018 og, i tillegg, data for temperatur, relativ fuktighet og nedbørsmengde tilbake til slutten av forrige års-eksponering i oktober/november 2015. Databasen består av meteorologiske data (T, RF og nedbørsmengde) og forurensningsdata, som gasskonsentrasjoner, mengde ioner i nedbør, partikkkelkonsentrasjoner og mengde avsatte partikler.

## Summary

*This report presents the environmental measurements for the UN/ECE ICP Materials trend exposure programme, 2017-2018, and, in addition, data for temperature, relative humidity, and precipitation amount back to the end of the previous annual exposure programme in October/November 2015. All the data collected from the participating test sites are reported here. Interpretation of the data related to effects on the corrosion of materials including cultural heritage, is presented in other ICP-reports. The UN/ECE international co-operative programme on effects on materials is an international project that measures and assesses the corrosivity of the atmosphere. The corrosion of exposed sample materials and the air pollutants and climate are measured at stations mainly in Europe. Exposure studies have been ongoing in the programme since 1987, in different phases, with long time continuous exposures (1987-1995), exposures connected to EU framework projects (2002-2003), and, since 2005, with annual trend exposures and measurements of the environment every third year, and also with some longer duration exposures of materials.*

The most recent annual, four- and eight-yearly exposure of corrosion material samples of: carbon steel, stainless steel, zinc, copper, limestone, coil coated steel, and soiling material samples of: modern glass limestone and marble, and environmental sampling, started at all the stations in October or November 2017. The annual samples were demounted in either October or November 2018. The four- and eight-yearly corrosion samples remain mounted on the racks. One set of eight-yearly weathering steel samples remaining from mounting in 2011, will be demounted in October 2019.

The exposures started at all the stations at dates between 19 October and 17 November. The annual average values for the environmental parameters were calculated from and including November 2017 for all the stations except one (no. 59) which did the mounting on the 17 November. For station no. 59, the annual average values for the environmental parameters were calculated from and including December 2017. Monthly values for the temperature, relative humidity and precipitation amount back to the end of the previous annual reporting period of October/November 2015 are also included.

Monthly (and tri- or a few cases four-monthly) values and annual average values for the period are reported in Appendix A and B.

Appendix A gives the monthly data reported directly from the ICP Materials test sites, for the exposure period 2017/18, and for temperature (T), relative humidity (RH) and precipitation amount (Prec) also for the exposure years 2015/16 and 2016/17. Appendix A also reports the tri-monthly, or four-monthly in the case of the two Czech stations no. 1 and 3, values for the same pollutant gases and for particle deposition, measured with IVL passive samplers and analysed at IVL, The Swedish Environmental Institute.

Appendix B gives the annual average values for the data reported directly from the ICP Materials test sites for the exposure year 2017/18, and for the same pollutant gases and for particle deposition measured with IVL passive samplers. Annex B also reports the annual average values for temperature (T), relative humidity (RH) and precipitation amount (Prec) for

the exposure years 2015/16 and 2016/17. Annex B reports the start and end dates for the material exposures and the months included in the calculation of the annual averages for the environmental parameters.

Appendix C and D give the original data from the IVL sampling, as reported by IVL. Appendix C gives the tri-monthly, or four-monthly in the case of the two Czech stations no. 1 and 3, mean values for particle deposition on IVL samplers in a position sheltered from rain and for passive sampling of pollutant gases. Appendix D gives the annual average values for the particle deposition and pollutant gases measured in a position sheltered from rain for the exposure period. Appendix E gives the data availability in % for the sampling performed.

Appendix F gives the daily rain amounts reported for the last month before demounting of samples in 2018. These data were collected especially to assist in the assessment of the observed changes in reflectivity of coil-coated surfaces after the exposures.

Appendix G gives an overview of which stations measured elemental and/or black carbon (EC/BC) in 2017/18 and by which method. This is an answer to a particular request about this information from the ICP Materials stations. The list of the data sources and acknowledgements for the data from the stations, reported to the data centre from 2014 to 2018, is given in Appendix H. A complete list of participants and national contact centres, participating in the 2017–2018 trend exposure programme, is given in Appendix I.

A good database for dose-response evaluation should have data with a wide range of values for the most important parameters. The 2017-2018 environmental data have a good spread in values for all important gases, as well as for the most important meteorological parameters.

# Trend exposure programme 2017 – 2018

## Environmental data report

### October 2017 to November 2018

#### **1 Introduction**

Airborne acidifying pollutants are known to be one major cause for corrosion of different materials including the extensive damage that has been observed on historic and cultural monuments. In order to fill some important gaps of knowledge in this field, the Executive Body for the Convention on Long-range Transboundary Air Pollution decided to launch an International Co-operative Programme on Effects of Air Pollution on Materials, including Historic and Cultural Monuments, ICP Materials. The programme was launched in 1985. Measurements have been running since September 1987 and has involved exposure of materials at more than 30 test sites in Europe (+ Israel) and North America.

Exposures were running for eight years at 39 test sites in 14 countries from 1987 to 1995 (Henriksen et al., 1997). A second phase of the project started in 1997 with an adjusted number of test sites: 30, and participating countries: 19 (Henriksen and Arnesen, 2003, Henriksen and Arnesen, 2000). During the interim period 1995 to 1997, trend analysis for metal corrosion and exposure of the glass and polymeric materials continued. In 2002-2003 the ICP Materials programme was combined with exposures in the EU project MULTI-ASSESS (EVK4-CT-2001-00044) (Henriksen et al. 2004). In 2005-2006, 2008-2009, 2011-2012 and 2014-2015 annual trend exposures with analysis of corrosion of materials samples, including samples of carbon steel, weathering steel, stainless steel, zinc, copper, aluminium and Portland limestone, and analysis of soiling of glass samples, were carried out. In 2017-2018 new exposures were started with the same materials and in addition corrosion samples of coil coated steel and soiling samples of limestone and marble.

For every period of the trend exposures, the environmental parameters are measured and reported. In 2005-2006, 22 stations in 13 European countries plus Canada participated. In 2008-2009, 24 stations in 14 European countries participated. In 2011-2012, 22 stations in 13 European countries participated. In 2014-2015, 24 stations in 16 European countries participated. In 2017-2018, 24 stations in 15 European countries and one in the USA participated.

NILU - Norwegian Institute for Air Research has been the sub-centre responsible for the environmental data collection, storing, evaluation and reporting during the whole programme. This report includes the environmental data reported from the 2017-2018 trend exposures. In addition it includes data for the climate parameters, temperature (T), relative humidity (RH) and precipitation (Prec.) from the end of the previous trend exposure period, November 2015. These climate data are reported as monthly values and as annual averages for the years 2015/16 and 2016/17.

The aim of the trend exposures, from 2005, is to follow the development of corrosion trends over time in Europe in the present situation with a changing pollution and climate situation.

The programme has changed focus during the time past. In 1987 the focus was on the impact of SO<sub>2</sub> and climate. Later the programme was enlarged to perform a quantitative evaluation of the effect of NO<sub>x</sub> and other pollutants like ozone and sulphur in combination with climatic parameters, on the atmospheric corrosion of important materials. New parameters like HNO<sub>3</sub> and particulate matter were introduced in the EU-project MULTI-ASSESS, and the study was expanded from corrosion to include soiling. In the new trend exposure programme from 2005, main indicator materials are exposed every third year and environmental parameters are collected.

The environmental data for the ICP Materials programme has been collected since September 1987. The environmental data from the three trend exposure periods from 2005 to 2014 are reported in Grøntoft and Ferm (2017, 2014) and Grøntoft et al. (2011, 2007).

The programme has been and is organised with Sweden as lead country and the Swedish Corrosion Institute (SCI), - from 2005 named “the Corrosion and Metals Research Institute” (KIMAB), is serving as the Main Research Centre. Sub-centres in different countries have been appointed, each responsible for the provision and analysis of one or more materials. The present materials Sub-centres are:

**Structural metals:**

- Steel and zinc (Sub-centre responsible for evaluation: SVUOM Praha a.s., Prague, Czech Republic)
- Weathering steel (CENIM, Madrid, Spain)
- Zinc (EMPA Corrosion/Surface Protection, Dübendorf, Switzerland)
- Copper and aluminium (KIMAB, Stockholm, Sweden)

**Painted materials.** Coil coated steel (HAMK Sheet Metal Centre, Häme University of Applied Sciences, Hämeenlinna, Finland)

**Stone materials.** Portland limestone (Building Research Establishment Ltd., Department of Environment, Waterford, United Kingdom).

**Glass and stone materials – soiling.** Université Paris XII (LISA)

NILU is, and has been through the whole programme, the sub-centre for the environmental database.

Other sub-centres through the history of the exposure programs, non-active in 2017-2018, are:

**Paint coatings.** Steel with silicon alkyd paint (Norwegian Institute for Air Research, Kjeller, Norway).

**Glass materials.** Two types of glass M1 and M3 (Institute of Chemistry, Academy of Fine Arts, Vienna, Austria)

Sub-centres for concrete and more stone materials, some of which are operational within the present trend exposure programme (see above), were active in the MULTI-ASSESS project 2002:

**Stone and concrete materials:**

- Standard Portland concrete, Latvian limestone (Riga Technical University, Riga, Latvia).
- Portland limestone, Carrara marble, Calcareous Baumberger sandstone (Building Research Establishment Ltd., Department of Environment, Waterford, United Kingdom).
- Gotland sandstone (Swedish Corrosion Institute, Stockholm, Sweden).

**Soiling materials:**

- Synthetic polymeric materials (Middelsex University, GB)
- Modern Glass (LISA – Universite Paris XII, Paris, France)

The range of materials that has been and can be exposed and related scientific partners/contacts is large.

Corrosion of carbon steel, zinc and Portland limestone and soiling of modern glass were measured in the trend exposures of 2005/6, 2008/9. In addition corrosion of weathering steel, copper and aluminium was measured in 2011/12, stainless steel in 2014/15, and coil coated steel and soiling of limestone and marble in 2017/18.

Simultaneously a range of environmental parameters was measured (for the 2017-18 campaign see Table 1 and Appendix A – B).

**Extended environmental analyses.** Passive HNO<sub>3</sub> and particle deposition measurements were introduced in the MULTI-ASSESS project (IVL Swedish Environmental Research, Gothenburg, Sweden), and were measured in the trend exposure programmes from 2005 to 2018. In 2011/12 also non-optional measurements of SO<sub>2</sub>, HCOOH, CH<sub>3</sub>COOH, HCl and HF gas and optional measurements of NH<sub>3</sub> gas were performed with IVL passive sampling method. IVL provide passive samplers for SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> to stations who do not measure these components with local instruments or samplers. The data reported from IVL is given in Appendix A to D.

## 2 The measuring programme

The measuring programme for the trend exposures in 2017-2018 is given in Table 1

*Table 1: The environmental measurement programme for the ICP Materials trend exposures 2017 – 2018, "standard parameters".*

<b>Components to be measured under topics</b>	
Mandatory	Gases : SO <sub>2</sub> , O <sub>3</sub> , NO <sub>2</sub> , HNO <sub>3</sub> (IVL)
	Precipitation : mm, pH, Cl <sup>-</sup>
	Particulates : Particle deposition (IVL)
	Climate : Temperature, relative humidity
Optional	Precipitation : Conductivity, SO <sub>4</sub> -S, NO <sub>3</sub> -N, NH <sub>4</sub> -N, Na <sup>+</sup> , Ca <sup>2+</sup> , Mg <sup>2+</sup> , K <sup>+</sup>
	Particulates : PM <sub>10</sub>

The measurements were partly performed with locally available equipment and partly with passive samplers from IVL-Sweden (Ferm, 1999).

The data were reported to the environmental sub-centre as monthly mean values, except for mm precipitation, which was reported as the monthly sum. Tri-monthly, or four-monthly in the case of the two Czech stations no. 1 and 3, mean data values from measurements with IVL passive methods were reported for HNO<sub>3</sub> gas concentrations and for particle deposition, for all sites, and for SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> gas concentrations where local monthly data where otherwise not available.

The data are presented as monthly (and three of four monthly for the IVL data) and annual average values for the project period.

The quality control of the reported data is the responsibility of the countries and partners that report the data. The environmental sub-centre will control the data reported for outliers and create the joint database. It will also perform an evaluation of the data files and look for trends in the data set.

## 3 Data from the monitoring test sites

The data are sent to the environmental sub-centre as Excel data files by e-mail.

All data presented by the environmental sub-centre are given with the same accuracy as in the reporting forms agreed upon. For data series which include values "below the detection limit", these are, by convention, replaced with one half of the reported detection limits when calculating the mean values.

## 4 Monthly mean concentrations

The average monthly data reported for the test sites for the trend exposure, October 2017 to November 2018, are given in Appendix A. The calculated average annual data are given in Appendix B. The tri-monthly (or four-monthly) values for particles and gases measured with IVL samplers are given with the monthly values in Appendix A. The calculated average annual values for particles and pollutant gases are given in Appendix B. The complete IVL data are given in Appendix C and D. The participating countries are reporting data on a monthly basis. The particle deposition, HNO<sub>3</sub>, and additional to local sampling of the gases SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> is analysed and reported from IVL, Sweden.

## 5 Calculation of monthly values

For their own test sites the participants shall calculate the mean values in accordance with the following equations.

- Mean temperature (T<sub>M</sub>)

T<sub>i</sub> = measured values

$$T_M = \frac{\sum_{i=1}^i T_i}{i}$$

*i = number of records* (1)

- Mean relative humidity (RH<sub>M</sub>)

$$RH_M = \frac{\sum_{i=1}^i RH_i}{i}$$

(2)

- Mean gas concentrations G<sub>M</sub>

$$G_M = \frac{\sum_{i=1}^i G_i}{i}$$

(3)

For some sites where complete information of the sampling period exists, another equation is used for mean gas concentrations

$$G_M = \frac{\sum_{i=1}^i (n_i \cdot G_i)}{\sum_{i=1}^i n_i}$$

(4)

*n<sub>i</sub> = sampling period*

- Precipitation

$$mm = \sum_{i=1}^i mm_i$$

(5)

The amount of precipitation is reported as the total amount for that month (in mm). This can be done without adjustment if the availability is 100%. If there are some missing data, however, this needs to be taken into account. As an example, consider a case when sampling is made each day for a month consisting of 30 days and where data for two of the days are missing, making the availability 28/30 = 93%. If the total amount of precipitation for the 28 days is (say) 28 mm, corresponding to an average precipitation of 1 mm/day, this means that the expected total amount of precipitation for that month should be reported as [30 mm, D, 93%]. In this example it is of course important to distinguish between a day measured to have no rain (counted as 0 mm) and a day with missing data (counted as 1 mm).

- Weighted mean pH ( $pH_M$ )

$$pH_M = -\log \frac{\sum_{i=1}^i [mm_i \cdot (10^{-pH_i})]}{\sum_{i=1}^i mm_i} \quad (6)$$

- Weighted mean values for cations, anions and conductivity ( $C_M$ )

$$C_M = \frac{\sum_{i=1}^i (mm_i \cdot C_i)}{\sum_{i=1}^i mm_i} \quad (7)$$

## 6 Sites

For the trend exposures taking place from 2017, a selection of exposure sites was made. The list of test sites over time for the UN/ECE ICP Materials project is given in Table 2 (extended from SCI, 2005). The sites with a not yet finalised measuring period onwards from 1987 (no end year) were participating in the 2017/18 trend exposures.

## 7 Regularity and quality of the reported data

The test sites represent areas from background level of pollutants (rural) to urban and industry levels. The background sites have historically had the best regularity for the data reported. Many of these sites belong to the EMEP monitoring programme and have long and good data records.

In urban and industrial areas it is generally more difficult to maintain sites. In programmes like ICP Materials with long exposure periods, it is sometimes necessary to move a test site due to local problems like new use of the property. In some countries the funding of the environmental measurements was limited in periods. This is reflected in the selection of measurement stations for the trend exposures.

A brief review of the quality of the reported data for the different test sites are given in the following pages.

### 7.1 Review of reported data in the trend exposure programme, 2014 – 2015.

#### Optional data

The reporting of data for cations in precipitation and for particle concentration, PM<sub>10</sub>, were optional in the programme. Full sets of monthly data for cations in precipitation are reported for sites 10, 21, 23, 31, 33, 44, 60 and 61. Full sets of monthly PM<sub>10</sub> data are reported for sites 1, 3, 10, 13, 15, 16, 23, 24, 31, 33, 45, 51, 53, 57, 59, 60 and 61.

#### Non optional IVL data

IVL data for SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> are reported from a number of sites, mainly those that didn't have local (non IVL) measurement results for these parameters from the stations – in which case the IVL measurements are non-optional. The non-optional IVL data (HNO<sub>3</sub> and particulate matter deposition) are reported from all the sites, except 50 and 59.

The IVL tri-monthly and annual average data for HNO<sub>3</sub> and particulate matter deposition, and for SO<sub>2</sub>, NO<sub>2</sub>, O<sub>3</sub>, where these were measured, are reported with the other station-data in Appendix A and B.

A review of the reporting of the mandatory data from the single countries and stations is given below.

#### Sites 1 and 3 Czech Republic

Sites 1 and 3 have complete sets of data, except for missing H<sup>+</sup> and Cl<sup>-</sup> data in some months with low precipitation: July 2017 for station no. 1 and February and July 2017 for station no 3.

#### Sites 10 and 41 Germany

Site 10 Bottrop has a complete data set for the period. For SO<sub>2</sub> values reported as < 10 mg/m<sup>3</sup>, a value of 5 mg/m<sup>3</sup> was used for the calculation of the annual average. Site 41 report all data except pH in precipitation in November and December 2017 and Cl<sup>-</sup> in precipitation, which are missing for the whole period. The gas data for station 41 are IVL data.

### **Sites 13, 14, 15 and 16 Italy**

The Italian stations report most of the data. H<sup>+</sup> and Cl<sup>-</sup> in precipitation, are missing from all the stations. SO<sub>2</sub> and O<sub>3</sub> are missing from station no. 16, Venice. In addition all the data for November 2018 are missing from station no. 13. The gas data for station no. 14 are IVL data.

### **Sites 21, 23 and 44 Norway**

The Norwegian stations report all the data, except for SO<sub>2</sub> in July 2018 at station 44. For station 21 and 44 the O<sub>3</sub> data is IVL data.

### **Sites 24 and 26 Sweden**

Station 24 report all the data except H<sup>+</sup> and Cl<sup>-</sup> in March 2018. Station 26 report all the data. The gas data are IVL data for both stations.

### **Sites 31 and 33 Spain**

The Spanish stations report all the data, except H<sup>+</sup> and Cl<sup>-</sup> in July 2018 when they were not measurable due to low rain amounts.

### **Site 40 France**

Site 40, Paris report all the data, except Cl<sup>-</sup> in October 2018. The SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> data are IVL data. The gas data are IVL data.

### **Site 45 Switzerland**

All the data are available for Site 45, Chaumont. IVL data are reported for SO<sub>2</sub> and are reported, in addition to the local (non IVL) data, for NO<sub>2</sub> and O<sub>3</sub>.

### **Site 50 Poland**

Site 50, Katowice, report all the data, except H<sup>+</sup> and Cl<sup>-</sup> in precipitation, which are missing for the whole period.

### **Site 51 Greece**

Site 51, Athens, report all the data, except Cl<sup>-</sup> in precipitation and pH in precipitation in March and April 2017, and August and October 2018, due to low precipitation amounts.

### **Site 53 Austria**

Site 53, Vienna, report all the data.

### **Site 57 Finland**

Site 57, Hämeenlinna, report all data, except H<sup>+</sup> and Cl<sup>-</sup> in precipitation in May 2018, due to low rain amount. SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> gas concentrations were measured with IVL samplers. NO<sub>2</sub> is also reported from local measurements, in Hämeenlinna centre about 3 km from the exposure site.

### **Site 58 USA**

Site 58, New Heaven report the climate data: T, RH and precipitation amount. The gas data and H<sup>+</sup> and Cl<sup>-</sup> in precipitation, are missing for the whole period.

## **Site 59 Slovakia**

Site 59, Žilina, report all the data, except missing RH in June 2018, and missing SO<sub>2</sub> in June, August, October and November 2018. Regarding the value for O<sub>3</sub> reported from Žilina:

*"A value of 153.5 µg/m<sup>3</sup> was initially reported from the Faculty of Civil Engineering, University of Žilina for a station located 42 m for the exposure rack. This included some months with a value higher than 400 mg/m<sup>3</sup>. These high values were evaluated to be uncertain, and it was therefore decided to use the annual mean value for 2018, of 43.6 µg/m<sup>3</sup>, reported for the EEA Network NETSK-001 urban background station in Žilina (EEA, 2019: <https://www.eea.europa.eu/data-and-maps/dashboards/air-quality-statistics-expert-viewer>). This station is about 1.5 km away from the rack. It was evaluated that the O<sub>3</sub> concentrations would be relatively similar at the two measurements locations"*

## **Sites 60 and 61 Kroatia**

The Croatian sites report all the data.

For Zagreb: PM<sub>10</sub>, SO<sub>2</sub> and NO<sub>2</sub> were measured on Zagreb-2 station about 200 m away from 61-Zagreb; O<sub>3</sub> was measured on Zagreb-3 station about 5 km away from 61-Zagreb. All parameters measured by Croatian Meteorological and Hydrological Service.

For Split: Precipitation samples for split are collected on Split-Marjan station (about 3 km away from 60-Split) and analysed by Croatian Meteorological and Hydrological Service; PM<sub>10</sub>, SO<sub>2</sub> and NO<sub>2</sub> are measured on Split-1 location (about 1 km away from 60-Split).

## **8 Data for regression analyses**

### **8.1 The data base**

For regression analyses the database for material damage for one year has to be correlated with the environmental database for the same period (Appendix B).

### **8.2 The data distribution**

It is important for the evaluation of the dose-response correlation for the environmental impact on the materials that there is as large spread as possible in the concentrations of the most important pollution parameters. In the following figures the ranked distributions of the yearly mean values for the climate and pollution parameters, for the exposure year 2017-2018, are given. The diamonds represent values for measurements with the local (non IVL) station equipment, whereas the squares represent values from measurements with IVL passive samplers.

In Figure 1 the spread in the SO<sub>2</sub>-concentrations for the year (2017-2018) is shown. The numbering of the sites is in accordance with Table 2. The measured SO<sub>2</sub> values range from 20.9 µg/m<sup>3</sup> in Žilina (no. 59) down to 0.2 µg/m<sup>3</sup> for Birkenes (no. 23). The distribution is uneven with about half of the stations below 2 µg/m<sup>3</sup>, then a gradually sharper increase between the stations to the highest value of 20.9 µg/m<sup>3</sup>. The distribution of the values for 2017-2018 was quite similar as for the period 2011/12 and 2014/15 (Grøntoft and Ferm, 2014), but with the highest value for Žilina closer to the highest value, for Kopisty, in 2011/12 (19.0 µg/m<sup>3</sup>), than, for Katowice, in 2014/15 (13.4 µg/m<sup>3</sup>). Somewhat higher values were measured at the five

highest measuring stations in 2017-2018, than in 2014/15. The range for the other stations were similar to 2014-2015 with values from 5 down to near 0  $\mu\text{g}/\text{m}^3$ .

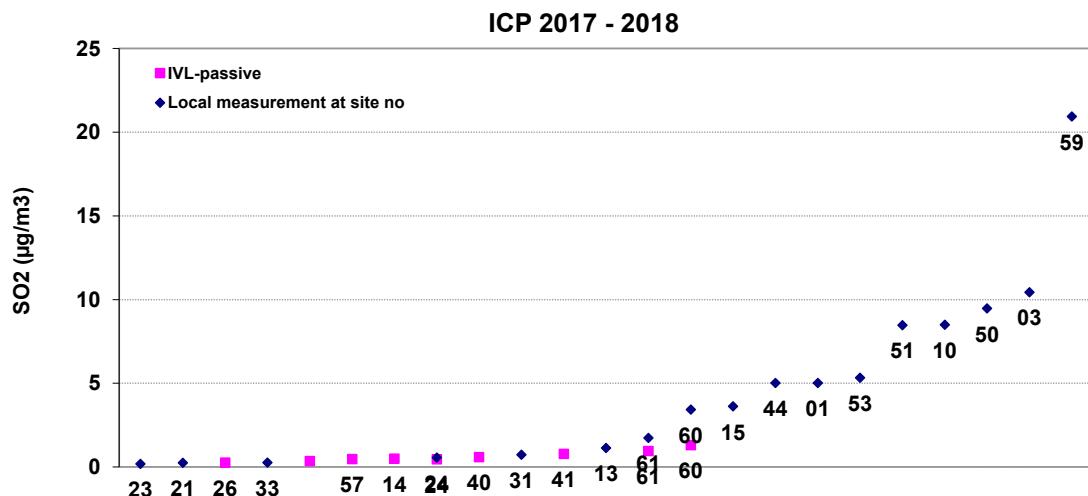

Figure 1: The spread in the yearly mean SO<sub>2</sub>-concentrations at the test sites for the test period in ICP Materials.

In Figure 2 the spread in the NO<sub>2</sub>-concentrations for the test period year is shown. The values range from 49.8  $\mu\text{g}/\text{m}^3$  for Rome down to 1.0  $\mu\text{g}/\text{m}^3$  for Birkenes. The distribution is fairly good, but with more station measuring values close to 20  $\mu\text{g}/\text{m}^3$  than in 2014-15. Where measurements were performed with IVL passive samplers in addition to being reported from locally administered measurement (LAM), the IVL results were considerably lower: For stations 24 (66 % of LAM), 45 (28 % of LAM), 57 (44 % of LAM), 60 (40 % of LAM), 61 (58 % of LAM), indicating that the concentration values at the position of the rack may be lower than at a measurement point at some distance from the rack. It is advised to use the values from the IVL samplers for correlation. The station with the lowest values are rural stations.

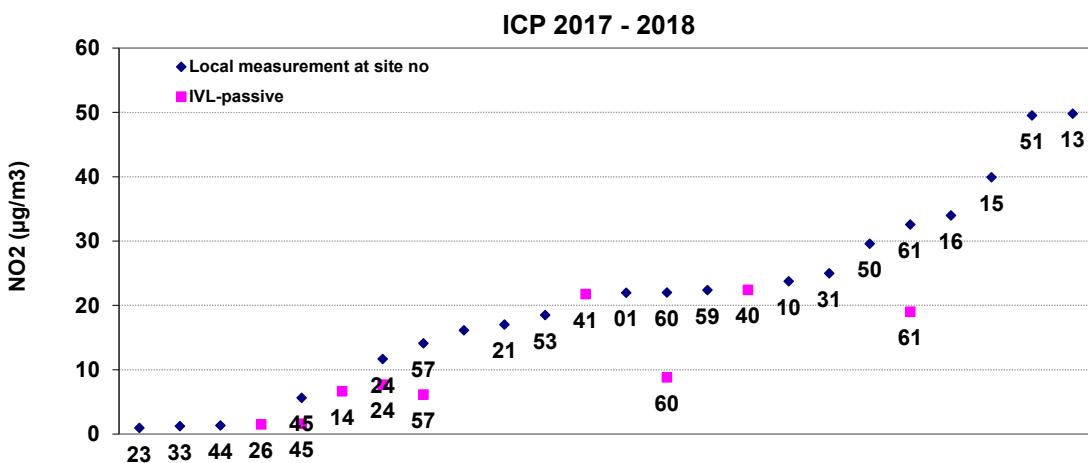

Figure 2: The spread in the yearly mean NO<sub>2</sub>-concentrations at the test sites for the test period in ICP Materials.

In Figure 3 the spread in the O<sub>3</sub>-concentrations for the test period is shown. The values range from 86.0 µg/m<sup>3</sup> in Toledo to 14.6 µg/m<sup>3</sup> for Athens. The Athens station is an urban traffic station where consumption of O<sub>3</sub> due to NO-emission is expected.

The distribution is fairly good between about 50 and 60 µg/m<sup>3</sup>, but with two stations (51, 41) measuring significantly lower values, 14.6 to 28.0 µg/m<sup>3</sup>, and three stations (60, 45, 33) measuring significantly higher values, 78.6, 80.7 and 86 µg/m<sup>3</sup>. For the four stations reporting both locally administered measurement (LAM) and IVL results, the values of the IVL results range from 0.94 (station no. 45) to 1.21 (station no. 23) to of the LAM results. (The reported LAM result for station 23 was corrected for "distance from rack" based on comparisons from a previous year)

The low values are observed in urban and industrial areas. The three highest values are in the south of Europe and close alpine area of Switzerland.

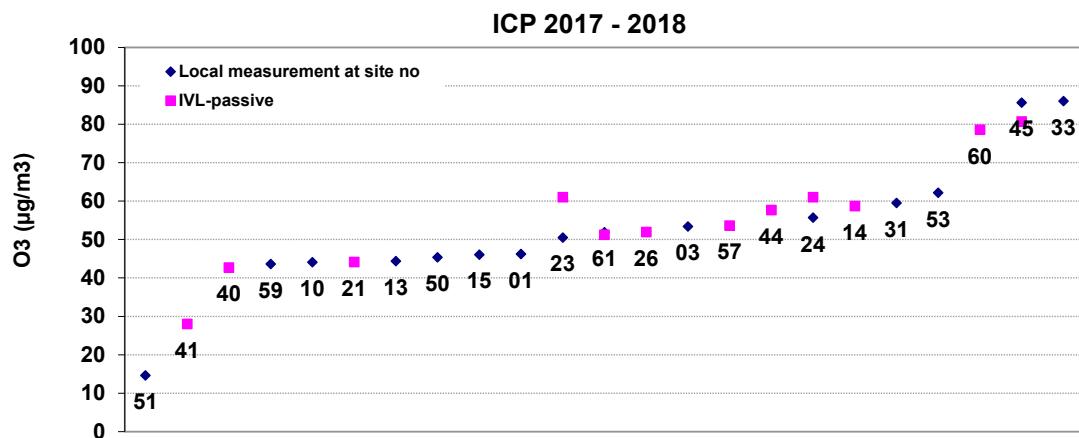

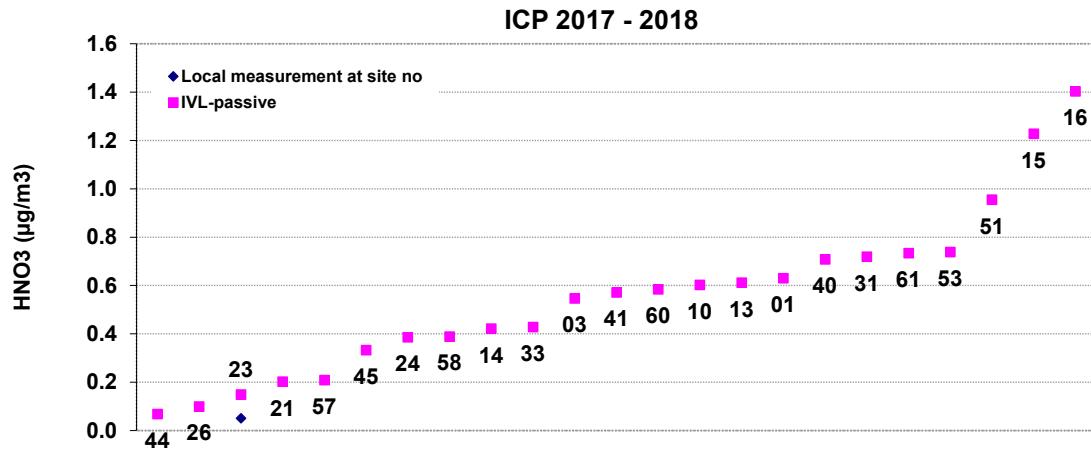

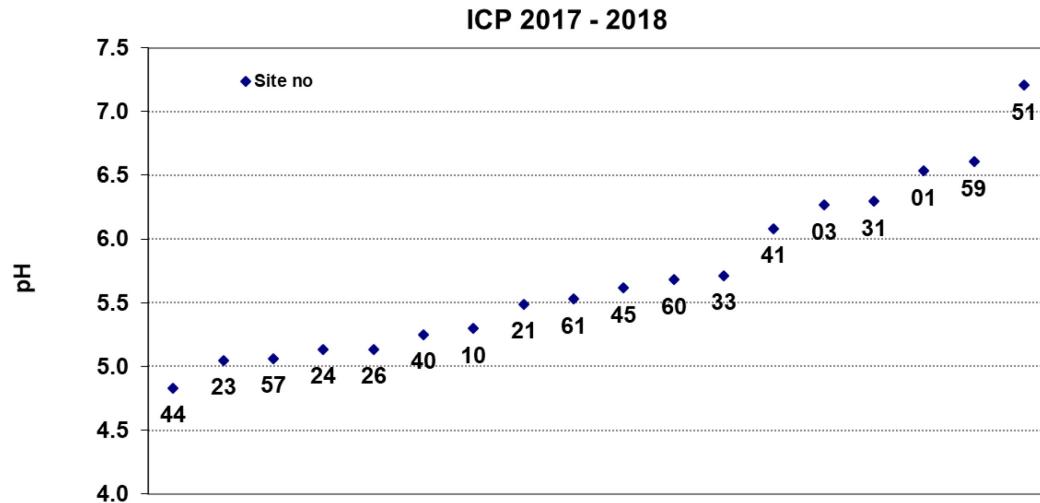

Figure 3: The spread in the measured yearly mean values for O<sub>3</sub>-concentrations at the test sites for the test period in ICP Materials.

In Figure 4 the spread for HNO<sub>3</sub>-concentrations, measured by IVL samplers, and in addition a separate local measurement at station no. 23, are shown. The figure shows yearly average values from tri-monthly sampling. The values range from 1.4 µg/m<sup>3</sup> in Venice (no. 16) down to 0.07 µg/m<sup>3</sup> for Svanvik (no. 44). The spread is fairly good, but with less stations (3 stations as compared to five stations in 2014/15) and a sharper rise in concentrations between stations above a concentration of 0.8 µg/m<sup>3</sup>, than in 2014/15.

*Figure 4: The spread in the measured yearly mean  $\text{HNO}_3$ -concentrations for the test sites for the test period for ICP Materials.*

In Figure 5 the spread for pH in the test period is shown. The pH values range from 7.2 for Athens (no. 51), then 6.6 for Žilina (no. 59), down to 4.8 in Svanvik. The highest values are observed in cities in southern and central Europe, the lowest values at northern stations. The spread is good with reporting from about the same no. of stations as in 2014/15 (18 vs. 19).

*Figure 5: The spread in the measured yearly mean pH-values at the test sites for the test period in ICP Materials.*

In Figure 6 the spread for temperature in the test period is shown. The yearly average temperature ranged from  $19.6^\circ\text{C}$  in Athens to  $6.3^\circ\text{C}$  in Hämeenlinna, as the next lowest value, down to  $0.8^\circ\text{C}$  for the far northern Svanvik station. The total range is slightly than in 2014/15. The temperature database covers the spread expected to be found over most of Europe.

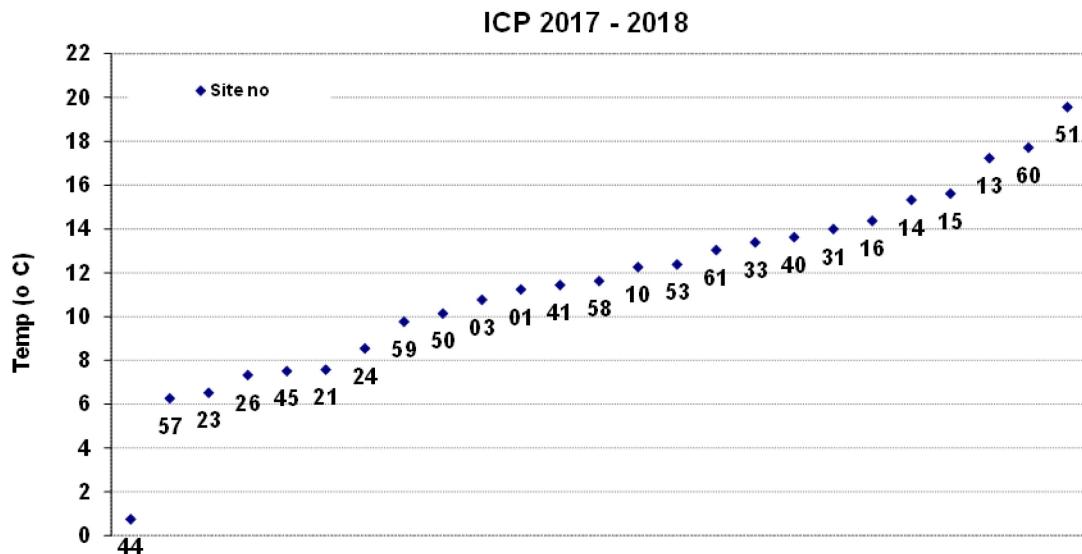

Figure 6: The spread in the measured yearly mean values for temperature at the test sites for the test period for ICP Materials.

In Figure 7 the spread for relative humidity in the test period is shown. The yearly average RH ranges from 79 % in Hämeenlinna down to 57 % in Athens. The spread is quite good, but with few station in the lower range up to about 68%. The RH database covers the spread expected to be found over Europe.

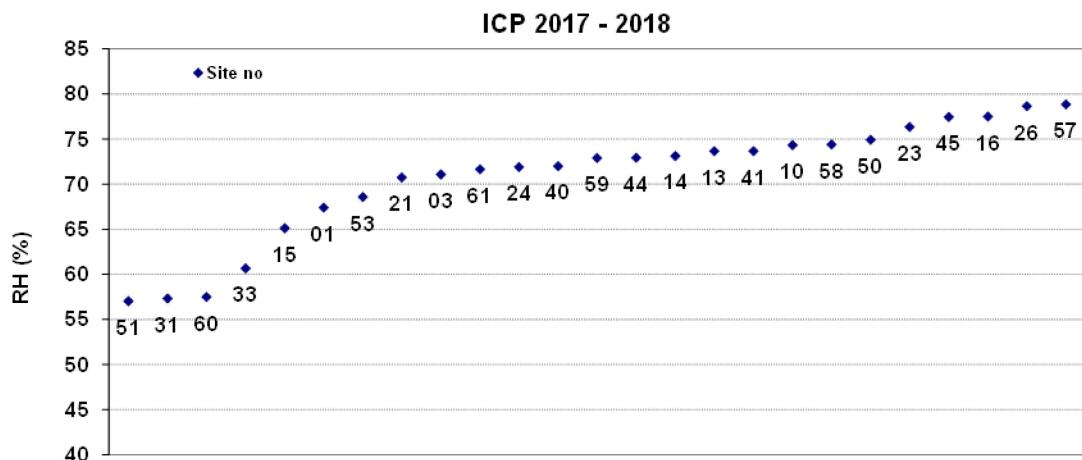

Figure 7: The spread in the measured yearly mean values for relative humidity at the test sites for the test period for ICP Materials.

In Figure 8 the spread for mm precipitation in the test period is shown. The spread is from 1425 mm at Birkenes (no. 23) down to 179 mm in Stockholm (no. 24). The value for Birkenes is significantly lower than in 2014/15 (2195), more similar to the value measured in 2011/12 (1544 mm), showing considerable fluctuations between years. The spread is good. It is expected that stations on the European west coast can have considerably higher average yearly precipitation amounts than recorded for the ICP stations, but this area is not well represented.

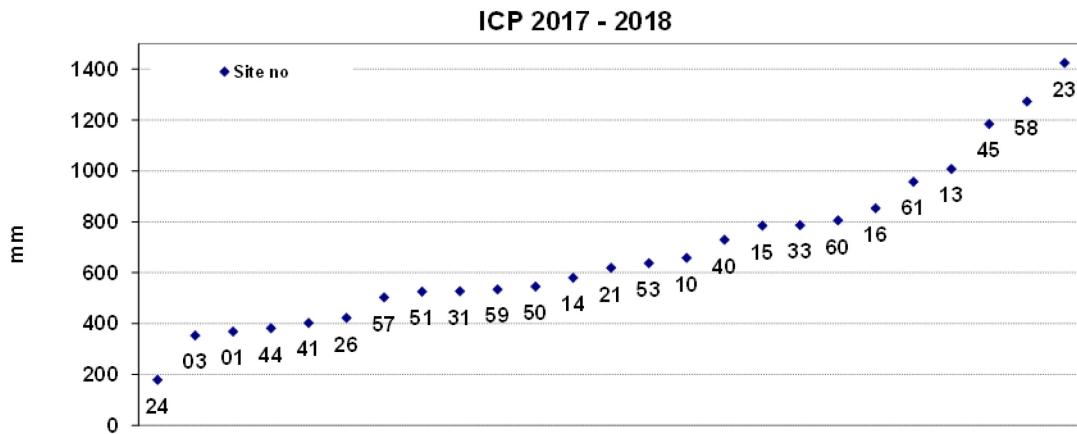

Figure 8: The spread in the measured yearly values for the total precipitation amount at the test sites for the test period for ICP Materials.

Figure 9 shows the spread in the amount of chloride (Cl-) in precipitation measured in the test period. The values range from 9.3 mg/l in Kopisty (no. 3) down to 0.15 mg/l in Chaumont (no. 45). Significantly higher values were measured at Kopisty than the maximum in Prague in 2014/15 (6.2 mg/l) and six stations measured above 2.5 mg/l, as compared to two stations in 2014/15. The spread is even from the low value of Chaumont up to the value of 3.6 mg/l for Oslo, but then significantly higher for stations no. 59 (Žilina, 5.2 mg/l), no. 60 (Split, 5.4 mg/l) and no. 3 (Kopisty).

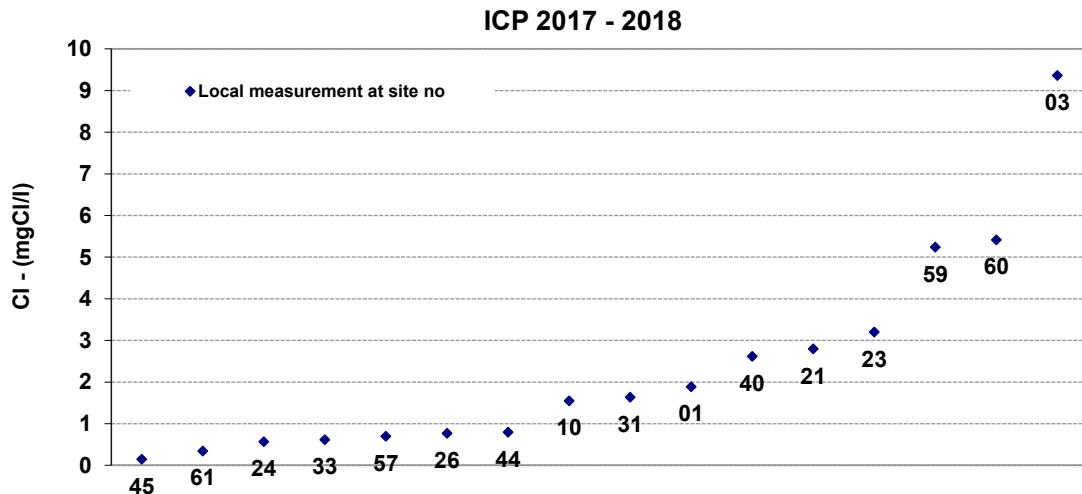

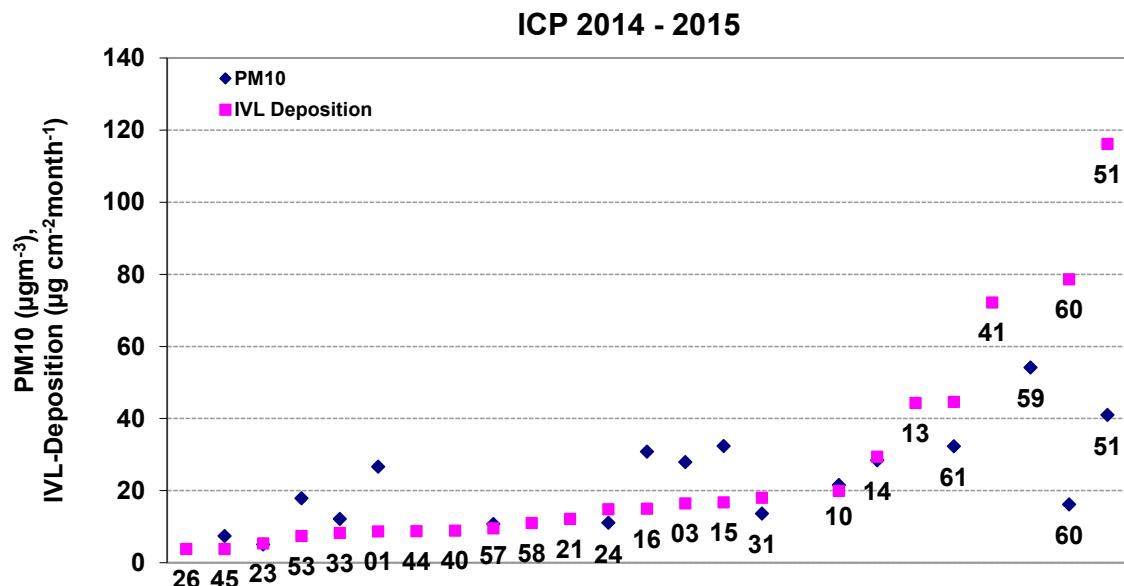

Figure 9: The spread in the measured yearly mean values for Cl- in precipitation at the test sites for the test period for ICP Materials.

Figure 10 gives the yearly annual results from the measurements of particles. Values are shown for PM<sub>10</sub> ( $\mu\text{g}/\text{m}^3$ ) from local (non IVL) measurements at the stations and for yearly averages of particle deposition ( $\mu\text{g}/\text{cm}^2\cdot\text{month}$ ) from tri-monthly sampling by using IVL passive particle deposition samplers exposed in a situation shielded from rain.

The PM<sub>10</sub>-values range from 54.2  $\mu\text{g}/\text{m}^3$  in Žilina (no. 59) to 5.1  $\mu\text{g}/\text{m}^3$  in Birkenes (no. 23). The particle deposition values range from 116.2  $\mu\text{g}/\text{cm}^2$  per month in Athens (no. 51) to 3.8  $\mu\text{g}/\text{cm}^2$  per month in Aspvreten (no. 26). The spread is good, but with a much steeper increase in the

measured deposition values for the six highest measuring stations, from no 14 (Milan, 29.4  $\mu\text{g}/\text{cm}^2$  per month) to Athens. Some more stations measured values above 20  $\mu\text{g}/\text{cm}^2$  per month than in 2014/15. The variation between years for the Berlin station was large, up to 72.2  $\mu\text{g}/\text{cm}^2$  per month in 2017/18, from 43.5  $\mu\text{g}/\text{cm}^2$  per month measured in 2014/15.

*Figure 10: The spread in the measured yearly mean values for PM<sub>10</sub>-concentration (blue diamonds) and particle deposition (red squares) at the test sites for the test period for ICP Materials. PM<sub>10</sub>-measurements are optional and were not performed at all the stations.*

Caution should be used in the interpretation of the optionally sampled PM<sub>10</sub>-data as the distance from the sampling station to the exposure site for the materials and other environmental measurements is unspecified. Some information about the locations for the PM<sub>10</sub> measurements is available in Tidblad and Gordon (2012).

## Conclusions

The database obtained during the trend exposure period 2017-2018 has comparable regularity and quality with the previous years of the ICP Materials programme. Sites belonging to the national surveillance programmes and EMEP, have the best regularity. Some of the urban sites have a lower regularity.

For the period 2017-18, all the stations reported precipitation amounts. pH in precipitation was missing from eight stations and Cl<sup>-</sup> in precipitation was missing from 10 stations (as compared to seven stations in 2014-15 and 10 stations in 2011-12). Data for SO<sub>2</sub> and O<sub>3</sub> were missing from station no. 16, Venice, and data for SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> from station no 58, New Heaven. Station 35, Lahemaa, did not report any environmental data for 2017/18.

Except the missing data for the precipitation quality (pH and Cl<sup>-</sup>) and for pollution gases from the two stations, the data coverage is, overall, quite good.

The spread in the data for the different environmental parameters is sufficient for statistical dose response analyses. The number of sites included in statistical treatment can be changed depending of the selection of parameters for the analyses.

Generally: IVL data should be used in material analysis rather than local data

1. Numerical values: Location measurement in addition to IVL values.

IVL passive samplers were used

Station 3: Two of three periods missing.

Station 23: The O<sub>3</sub> values were corrected according to "O<sub>3</sub> old/new Birkenes 2010" = 0.76. IVL sample data will be official.Station 24: SO<sub>2</sub>, NO<sub>2</sub> and O<sub>3</sub> values were reported as optional data. The main data are from passive samplers. The IVL sampling data are official. Data were taken from nearby stations: Kaanan and Sveavägen. For pH and Cl in March 2018: The current was turned off, and no sample was collected.Station 26: T values are from station Berga Mo - 0.5°C. RH and Prec. data are from station Tullinge A. H<sup>+</sup> and Cl<sup>-</sup> data are from station Edeby.

Station 45: One of four periods missing.

Station 57: Hämeenlinna centre of town.

Station 58: Adjusted from inches.

Station 59: Zilina EEA urban background station.

Stations 60 and 61: Second period reported, of one days exposure with high deposition, disregarded in the annual average.

**Appendix G**  
**Elemental and/or black carbon (EC/BC) measurements and  
methods at the stations 2017/18**

<b>Availability of black or elemental carbon measurements at ICP-materials stations in 2018</b>		
Station no.	Are there Black Carbon (BC) or Elemental Carbon (EC) measurements at the station? (Yes/No):	Method of mesurement of BC and/or EC:
01	OC, EC, TC, PYC	EUSAAR. On a daily basis but also as yearly average.
03	NO	
10		No information
13	NO	
14	NO	
15	BC since 2013	Multi Angle Absorption Photometer (MAAP) Thermo Scientific Model 5012 - Aethalometer Magee mod. AE22
16	NO	
21	NO	
23	EC/OC since 2010	Thermal-optical_analysis. Analytical instrument manufacturer: Sunset Laboratory Analytical instrument model: OCEC Lab Instrument Model 5
24	BC at "Torkel,"	Aethalometer. AE33 made by "Aerosol": <a href="https://mageesci.com/our-products/ae33/">https://mageesci.com/our-products/ae33/</a> . Method: Optical method where the reduction in light is measured at seven wave-lengths (370, 470, 520, 590, 660, 880, och 950 nm) after passage of a filter with the collected particles on it. The measurement at 880 nm represents the concentration of soot particles (black carbon). The instrument applies a so called dual spot technique, which implies that the measured values are continuously corrected for non-linear effects at high filter load (low transmittance).
26	NO	
31	NO	
33	EC	Thermal optical method. Six daily data per month on PM2.5 filters
35	EC/OC	Thermal-optical_analysis. Standard NISOH 5040, CEN/TR 16243:2011
40	NO	Unfortunately we don't have this measurement yet. But we have bought an aethalometer to do it during the next campaigns.
41	NO	
44	NO

## **Appendix H**

### **Data sources and acknowledgements to data**

1. Data sources		
2. Acknowledgements		
1 Prague	1	SVUOM passive sampling. Czech meteo station 1-2 km away from exposure rack.
	2	
3 Kopisty	1	SVUOM passive sampling. Kopisty meteo station (where the material exposures are performed)
	2	
10 Bottrop	1	Landesamt für Natur, Umwelt und Verbraucherschutz Nordrhein-Westfalen (LANUV): meterology, gases, rain amount, PM10 / Deutsches Bergbau-Museum Bochum: precipitation data
	2	Landesamt für Natur, Umwelt und Verbraucherschutz Nordrhein-Westfalen (LANUV)
13 Rome	1	Pollutants: Istituto Superiore di Sanità. Meteoclimatic parameters: SIARL - Servizio Integrato Agrometeorologico della Regione Lazio
	2	
14 Casaccia	1	Meteoclimatic parameters: ENEA - Agenzia nazionale per le nuove tecnologie, l'energia e lo sviluppo economico sostenibile
	2	
15 Milan	1	ARPA Lombardia - Agenzia Regionale per la Protezione dell'Ambiente della Lombardia - U.O. Centro Regionale Monitoraggio Qualità dell'Aria (SO2, NO2, O3, PM10)- Servizio Meteorologico Regionale (T, RH, prec.)
	2	
16 Venice	1	NO2, PM10: ARPAV - Agenzia Regionale per la Prevenzione e Protezione Ambientale del Veneto. Meteoclimatic parameters: Ente della Zona Industriale di Porto Marghera
	2	
21 Oslo	1	All parameters were measured by NILU at the Skøyen station, except Temp. and RH and Prec amount (mm) which were measured by the Norwegian Meteorological Institute at the Blindern station 3.5 km from Skøyen to the north east
	2	NILU-Norwegian Institute for air research; Temperature and RH: The Norwegian Meteorological Institute, Met.no, eklima ( <a href="http://sharki.oslo.dnmi.no/">http://sharki.oslo.dnmi.no/</a> )
23 Birkenes	1	All parameters were measured by NILU at the Birkenes station. The gases were measured to the Birkense observatory about 100 m distance and 50m elevation from the samples. O3 was corrected according to O3 old/new Birkenes 2010 = 0.76
	2	NILU-Norwegian Institute for air research; Temperature and RH for August 2015: The Norwegian Meteorological Institute, Met.no, eklima ( <a href="http://sharki.oslo.dnmi.no/">http://sharki.oslo.dnmi.no/</a> )
24 Stockholm South	1	All reported parameters delivered by Lars Burman, SLB analysis (Stockholm Air and Noise Analysis), Stockholm Environmental Administration
	2	SLB analysis (Stockholm Air and Noise Analysis), Stockholm Environmental Administration
26 Aspvreten	1	Data for Aspvreten (-2017) delivered by Zahra Hamzavi, Department of Environmental Science and Analytical Chemistry, Stockholm University. Data for other stations (2018-) from SMHI public data and processed by Johan Tidblad (Rise KIMAB). Data from Edeby delivered by Gunilla Pihl Karlsson, (IVL)
	2	Department of Environmental Science and Analytical Chemistry, Stockholm University. Swedish Environmental Protection agency and County Administrative Board of
31 Madrid	1	Ministry for the Ecological Transition (MITECO); Air Quality Madrid Regional Government (CAM)
	2	Ministry for the Ecological Transition (MITECO); Air Quality Madrid Regional Government (CAM); Carlos III Health Institute (ISCIII)
33 Toledo	1	AEMET-Spanish Meteorological State Agency
	2	AEMET-Spanish Meteorological State Agency
35 Lahemaa	1	All parameters were measured by EERC at the Lahemaa station
	2	Estonian Environmental Research Centre- EERC
40 Paris	1	Temp, RH and Amount of precipitation are Meteofrance data; pH and precipitation composition are measured in LISA (by Ion chromatography); Gases and PM10 by IVL
	2	

41	Berlin		Before 2016: All data except "H+ - pH" is from "Senatsverwaltung für Stadtentwicklung und Umwelt Berlin", "H+ - pH" is from "Rathgen-Forschungslabor Berlin"; From 2016 the T and RH and rain amount (mm) are from the meteorological station 403 Berlin-Dahlem (FU). Ph was measured by HTW Berlin									
		1										
		2	See above									
44	Svanvik	1	All parameters were measured by NILU at the Svanvik station.									
		2	NILU-Norwegian Institute for air research									
45	Chaumont	1	All gases, particles and precipitations was measured by Empa, all climate data (Temp, RH) was measured by MeteoSchweiz									
		2	Empa data: NABEL (BAFU and Empa), data of MeteoSchweiz: MeteoSchweiz									
50	Katowice	1	All meteorological parameters were mesured by Institute of Meteorology and Water Management National Research Institute in Poland. All pollution parameters were measured by Main Inspectorate of Environmental Protection in Poland									
		2	All meteorological parameters were mesured by Institute of Meteorology and Water Management National Research Institute in Poland. All pollution parameters were measured by Main Inspectorate of Environmental Protection in Poland									
51	Athens	1	SO2,NO2,O3 & PM10: measured by National Network for Atmospheric Pollution Monitoring (NNAPM), Ministry of Environment & Energy/ Temp, RH, Rain: measured by National Observatory of Athens (NOA)									
		2	SO2,NO2,O3 & PM10: NNAPM, Ministry of Environment & Energy/ Temp, RH, Rain: NOA									
53	Vienna"		The measurements are mede by the ZAMG (Zentralanstalt für Meteorologie und Geodynamik = Central Institute for Meteorology and Geodynamics, Hohe Warte 38, 1190 Vienna/Austria									
		1										
		2										
57	Hämeenlinna	1	Parameters measured by HAMK & KVY (pH & Cl-), City of Hämeenlinna (NO2 and PM10), Finnish Meteorological Institute (temp, RH, precipitation amount)									
		2	Finnish Meteorological Institute									
58	New Haven	1	Temperature, RH, and Precipitation parameters obtained from NOAA Local Climatological Data, New Haven Tweed Airport, CT, US (41.26389°, -72.88722°), 8.44 kilometers from collection site.									
		2	NOAA - National Oceanic and Atmospheric Administration									
59	Žilina	1	Research Centre of University of Žilina, Slovakia; Slovak Hydrometeorological institute (SHMÚ) and Faculty of Civil Engineering, University of Žilina, Slovakia.									
		2	Research Centre of University of Žilina, Slovakia; Slovak Hydrometeorological institute (SHMÚ) and Faculty of Civil Engineering, University of Žilina, Slovakia.									
60	Split	1	Precipitation samples are collected on Split-Marjan station (about 3 km away from 60-Split) and analysed by Croatian Meteorological and Hydrological Service; PM10, SO2 and NO2 are measured on Split-1 location (about 1 km away from 60-Split); data will be available on the Croatian Agency for Environment and Nature (CAEN) web pages in may and will be sent soon after that; O3 is not measured in Split; Geographical coordinates: 60-Split 43.511667N 16.464852E, ST-1 43.510653N 16.449342E, ST-Marjan 43.508333N									
		2	Croatian Meteorological and Hydrological Service and Croatian Agency for Environment and Nature (CAEN)									
61	Zagreb	1	All parameters measured by Croatian Meteorological and Hydrological Service; (PM10, SO2 and NO2 measured on Zagreb-2 station (about 200 m away from 61-Zagreb; O3 measured on Zagreb-3 station (about 5 km away from 61-Zagreb). Geographical coordinates: 61, Zagreb: 45.8219N 16.0331E, ZG-2: 45.8237N 16.0358E, ZG-3: 45.7816N 16.0065E									
		2	Croatian Meteorological and Hydrological Service and Croatian Agency for Environment and Nature (CAEN)

## **NILU – Norwegian Institute for Air Research**

NILU – Norwegian Institute for Air Research is an independent, non-profit institution established in 1969. Through its research NILU increases the understanding of climate change, of the composition of the atmosphere, of air quality and of hazardous substances. Based on its research, NILU markets integrated services and products within analysing, monitoring and consulting. NILU is concerned with increasing public awareness about climate change and environmental pollution.

*NILU's values:*      *Integrity - Competence - Benefit to society*

*NILU's vision:*      *Research for a clean atmosphere*

NILU – Norwegian Institute for Air Research
