## PRECIPITATION CHEMISTRY AT THE NORWEGIAN BACKGROUND STATIONS. 1982

This report presents precipitation chemistry data and measurements of sulphur dioxide, particulate sulphate and nitrogen dioxide in air for 1982, based on samples collected at 18 background stations in Norway. Ten of the stations were operated as part of the Norwegian national environmental monitoring programme (Statlig program for forurensningsovervåking) which started in 1981 with The State Pollution Control Authority (SFT) as responsible for the co-ordination and implementation of the programme. Six of these stations are also part of the Co-operative programme for Monitoring and Evaluation of the Long Range Transmission of Air Pollution in Europe (EMEP), in operation from 1978.

This data report is a supplement to the SFT yearly report for 1982 (Statens forurensningstilsyn, 1983), including the precipitation chemistry data from 9 supplementary NILU-stations. Of these, 3 stations have daily sampling (Lista, Vatnedalen, Løken), four have weekly sampling (Vikedal, Vardø, Skrova, Kise (week)) and two stations have monthly sampling (Ås and Kise (month)).

The air samples of sulphur dioxide, particulate sulphate and nitrogen dioxide are made daily, except at Vardø and Skrova with sampling three times a week.

The Norwegian background measurements of zinc, cadmium and lead in precipitation at 4 stations are only presented in the SFT-report. Reference is also made to the SFT-report for description of analytical methods and the discussion of the data.

The data are presented as monthly and yearly values. The daily values are available at NILU.

At the monthly precipitation sampling stations at As and Kise the monthly mean concentrations of the main components are generally higher than measured at the stations with daily precipitation sampling. This is probably due to greater dry deposition from local and long-range transported pollutants when using monthly bulk sampling. In addition the evaporation from the bulk sampler may cause higher concentrations particularly in the summer season and with small precipitation amounts.

REFERAT (maks. 300 anslag, 7 linjer) Rapporten inneholder nedbørdata for 18 norske bakgrunnsstasjoner i 1982. Den kjemiske sammensetningen av nedbørprøvene er presentert som måneds- og årsverdier. Årsverdiene er også gitt for hver stasjon fra deres start.			

TITLE Precipitation chemistry at the Norwegian background stations, 1982.

ABSTRACT (max. 300 characters, 7 lines)

The precipitation quality data measured in 1982 at 18 Norwegian background stations are presented. The chemical composition is given as monthly and yearly values. Yearly values from the start of each station are also given.
