SAMMENDRAG

Denne rapporten inneholder en oppsummering av data fra kontinuerlige målinger av nitrogenoksider, karbonmonoksid og ozon fra 6 stasjoner i Oslo. Målingene representerer en del av en metodeundersøkelse for luftforurensninger i byer og tettsteder, som utføres på oppdrag fra Statens forurensningstilsyn. Det ble opprettet 6 stasjoner med kontinuerlige målinger av nitrogenoksider (målt på 6 stasjoner), karbonmonoksid (målt på 2 stasjoner) og ozon (målt på 1 stasjon).

DATAKVALIATET

Datakvaliteten av måling av nitrogenoksider varierte en del fra stasjon til stasjon. NOx- og NO-data var av rimelig god kvalitet for alle stasjoner, bortsett fra Dronningparken. Vi regner med at de døgnmidlete målingene av NO_2 var av en så god kvalitet at vi valgte å bruke dem som kvalitetskriterium for de kontinuerlige målingene av NO_2.

Kvaliteten på de kontinuerlige NO_2-dataene var jevnt over ikke tilfredstillende. Svakheten ligger i manuell avlesning av NO_2, som differansen mellom en plottet NOx- og NO-kurve. Vi regner med at bruk av dataloggere i de kontinuerlig registrerende instrumenter vil føre til forbedring av denne formen for målinger. Det vil imidlertid knyttes stor usikkerhet til kontinuerlige målinger av NO_2 der konsentrasjonsnivåer er lavere enn 25 µg NO_2/m^3. Den beste metoden til å begrense "drift" i instrumentet (dvs. gradvis endring av nullpunkt) er å øke inspeksjonshyppigheten. Dette vil imidlertid øke kostnadene for denne type målinger.

Stasjon St. Olavs gt hadde perioder med god og dårlig kvalitet på datamengden. Stasjon Nordahl Bruns gt hadde dårlig datakvalitet. Målingene viste 50-75% for lave verdier. Stasjon Rådhusgata hadde perioder med god og dårlig kvalitet på datamengden. Stasjon Kontraskjæret hadde bra kvalitet på målinger under 100 µg/m^3, mens verdier over dette nivå sannsynligvis viste et noe for høyt nivå. Stasjon Dronningparken har gitt data av dårlig kvalitet. Målingene viste for

lave verdier over hele måleområdet. Stasjon Ullevål Nord hadde også dårlig kvalitet på NO_2-dataene. Her ble det målt for lave verdier i området 0-50 $\mu g/m^3$, og til dels for høye verdier i området over 100 $\mu g/m^3$.

CO-data fra St. Olavs gt og Nordahl Bruns gt og O_3-data fra St. Olavs gt ser ut til å være av god kvalitet.

RESULTATER

Høyeste registrerte timesverdi av NO_2 var 865 $\mu g/m^3$ i St. Olavs gt. i desember 1986. Dette er 2,5 ganger så mye som anbefalt øvre grenseverdi fra SFT. CO ble målt i St. Olavs gt og Nordahl Bruns gt. Høyeste målte CO-verdi var 29 mg/m^3 i St. Olavs gt i januar 1987. Anbefalt grenseverdi fra SFT er 25 mg/m^3. O_3 ble kun målt i St. Olavs gt i perioden fra februar til april 1987. Høyeste målte verdi var 178 $\mu g/m^3$ i april 1987. SFTs anbefalte grenseverdi er 100-200 $\mu g/m^3$.

Antall overskridelser av grenseverdier for NO_2 på den enkelte målestasjon må ses i lys av datakvaliteten der. Ullevål Nord hadde 7 overskridelser av øvre grenseverdi (350 $\mu g/m^3$), men målingene viste sannsynligvis til dels mye for høye verdier i området over 100 $\mu g/m^3$. Rådhusgata hadde ingen overskridelser av øvre grenseverdi, men der viste målingene sannsynligvis 25% for lave verdier. Kontraskjæret hadde 4 overskridelser av øvre grenseverdi, men der har sannsynligvis målinger over 100 $\mu g/m^3$ vist et noe for høyt nivå.

Oksidasjonsgraden (NO_2/NOx) er i denne rapporten et forholdstall som angir forholdet mellom mengden av *nitrogendioksid* og total mengde av *nitrogenoksider* i lufta. For de aktuelle målingene vil en trafikkbelastet gate med dårlig utlufting gi en lav oksidasjonsgrad. Mindre trafikk og bedre utlufting gir høyere oksidasjonsgrad. Måleresultatene stemmer overens med dette.

INNHOLD

METODEUNDERSØKELSEN I OSLO 1986-87
MÅLING AV NOx, CO OG O_3

1 INNLEDNING

I forbindelse med prosjektet "Metodeutvikling for undersøkelser i byer og tettsteder", som utføres på oppdrag fra Statens forurensningstilsyn (SFT), ble det opprettet 6 målestasjoner for kontinuerlig registrering av nitrogenoksider, karbonmonoksid og ozon. Det ble målt timesmiddelverdier i perioden fra august 1986 til mai 1987.

Denne rapporten presenterer resultater fra alle 6 målestasjonene. Det er også laget delrapporter med utførlig behandling av data fra alle 6 målestasjonene, se referanselisten.

2 STASJONSPLASSERING

Målestasjonenes plassering er vist på figur 1 og figur 2.

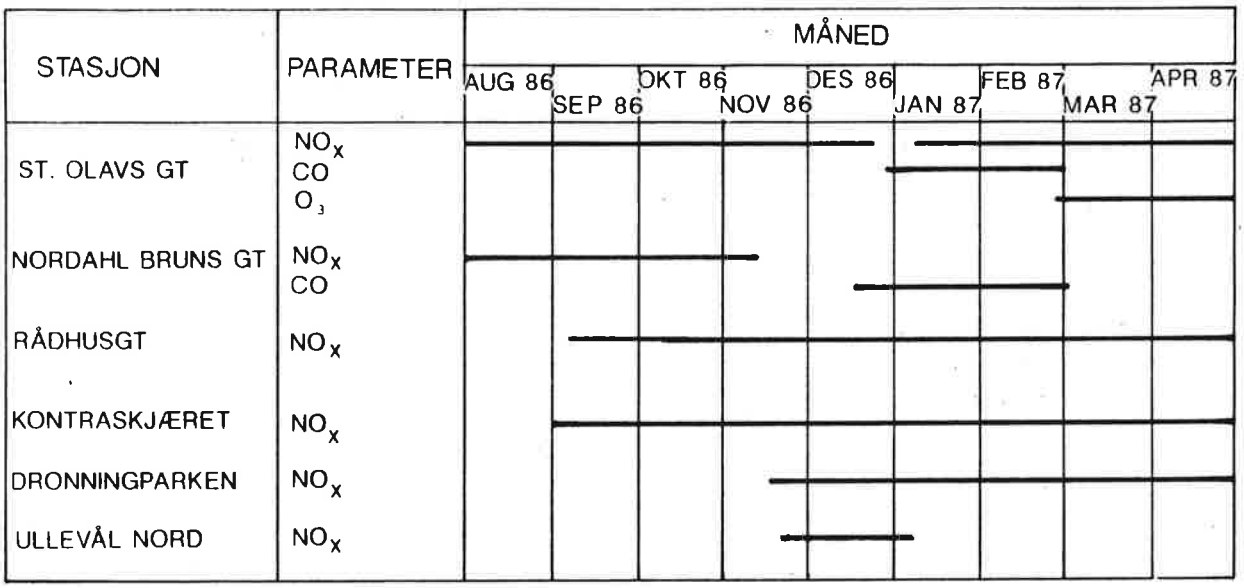
6) Ullevål Nord.

3 DATAKVALITET OG TILGJENGELIGHET

Kontinuerlige målinger av CO og O_3 ser ut til å ha gitt data av god kvalitet. NO- og NOx-data fra Dronningparken er av dårlig kvalitet, mens tilsvarende data fra de øvrige 5 stasjoner er av god kvalitet. NO_2-nivået, som ble manuelt avlest som en prosentvis forskjell mellom NOx- og NO-kurven, er stort sett av mindre god kvalitet.

Figur 3 viser måleperiodene for de ulike luftkjemiske parametre fra alle 6 målestasjoner i hele registreringsperioden. Tabell 1 viser datatilgjengeligheten.



Figur 3: Måleperiodene for de ulike luftkjemiske parametre for alle målestasjoner i hele registreringsperioden.

Tabell 1: Datatilgjengelighet. Målestasjoner for kontinuerlig registrering av NOx, CO og O_3 i Oslo, 1986/87.

Kontinuerlige målinger av CO i St. Olavs gt og Nordahl Bruns gt ser ut til å ha gitt data av god kvalitet. Det samme kan sies om O_3-målingene fra St. Olavs gt.

Datakvaliteten fra NOx-målingene varierer en del fra stasjon til stasjon. NOx- og NO-verdien blir avtegnet som to kurver på en papirrull og disse blir senere avlest manuelt. NO_2-verdien blir avlest som differansen mellom disse to kurvene - i prosent. En liten forskjell mellom to høye tall kan i verste fall gi en usikkerhet på ± 50 $\mu g/m^3$. Normalt vil denne usikkerheten være i området ± 25 $\mu g/m^3$. Det er tidligere foretatt døgnmidlete målinger av NO_2 fra de samme stasjoner, se referanselisten. Vi antar at disse døgnmidlete målingene er av en så

god kvalitet, at vi har valgt å bruke dem som kvalitetskriterium for de kontinuerlige målingene. Nedenfor er NO_2-data fra samtlige stasjoner kommentert. NOx- og NO-data er ikke kommentert med mindre de er av dårlig kvalitet.

St. Olavs gt

Kontinuerlige verdier for NO_2 fra St. Olavs gt var av blandet kvalitet. I de 9 måneder målingene pågikk (august 86-april 87), hadde deler av desember 86 og perioden februar-april 87 til dels mye for lave verdier. Øvrige NO_2-data ser ut til å være av rimelig god kvalitet, men også disse målingene viste periodevis opp til 15% for lave verdier.

Nordahl Bruns gt

Kontinuerlige verdier for NO_2 fra Nordahl Bruns gt ser ut til å være av dårlig kvalitet i hele måleperioden (august-november 1986). En sammenligning med døgnmidlete data tyder på 50-75% for lave verdier.

Rådhusgata

Kontinuerlige verdier for NO_2 fra Rådhusgata har gitt data med dårlig kvalitet de tre første måneder av måleperioden som pågikk fra september 1986 til april 1987. Øvrige NO_2-data er av bra kvalitet,men en sammenligning med de døgnmidlete målingene antyder 25% for lave verdier.

Kontraskjæret

Kontinuerlige verdier for NO_2 fra Kontraskjæret ser ut til å være av god kvalitet opp til verdier på ca. 100 $\mu g/m^3$. Verdier over dette viser sannsynligvis et noe for høyt nivå.

Dronningparken

NO- og NOx-data fra Dronningparken ser ut til å være av dårlig kvalitet. Kontinuerlige verdier for NO_2 fra Dronningparken har gitt data av dårlig kvalitet. Sammenlignet med døgnmidlete målinger var NO_2-verdiene for lave over hele måleområdet.

Ullevål Nord

Kontinuerlige verdier for NO_2 fra Ullevål Nord er av dårlig kvalitet. Sammenlignet med døgnmidlete målinger viste de for lave verdier i området 0-50 $\mu g/m^3$, og til dels mye for høye verdier i området over 100 $\mu g/m^3$.

4 RESULTATER

4.1 MÅLERESULTATER NO, NOx, NO_2, CO OG O_3

Høyeste målte NO_2-verdi var 865 $\mu g/m^3$ i St. Olavs gt i desember 1986. Denne usikre måleverdien er 2,5 ganger så høyt som anbefalt øvre grenseverdi fra SFT. CO ble målt i St. Olavs gt og Nordahl Bruns gt. Høyeste målte CO-verdi var 29 mg/m^3 i St. Olavs gt i januar 1987. Anbefalt grenseverdi fra SFT er 25 mg/m^3. O_3 ble kun målt i St. Olavs gt i perioden fra februar til april 1987. Høyeste målte verdi var 178 $\mu g/m^3$ i april 1987. SFTs anbefalte grenseverdi er 100-200 $\mu g/m^3$.

Tabell 2 gir en oversikt over månedlige middel- og maksimalverdier fra alle stasjoner i hele måleperioden. Tabellen bør sammenlignes med tabell 1, som gir datatilgjengeligheten.

Tabell 2: Kontinuerlige målinger av NOx, CO og O_3 i Oslo 1986-87. Månedlige middel- og maksimalverdier. NOx er regnet som NO_2. Enheter: NOx og O_3 : $\mu g/m^3$. CO: mg/m^3 .

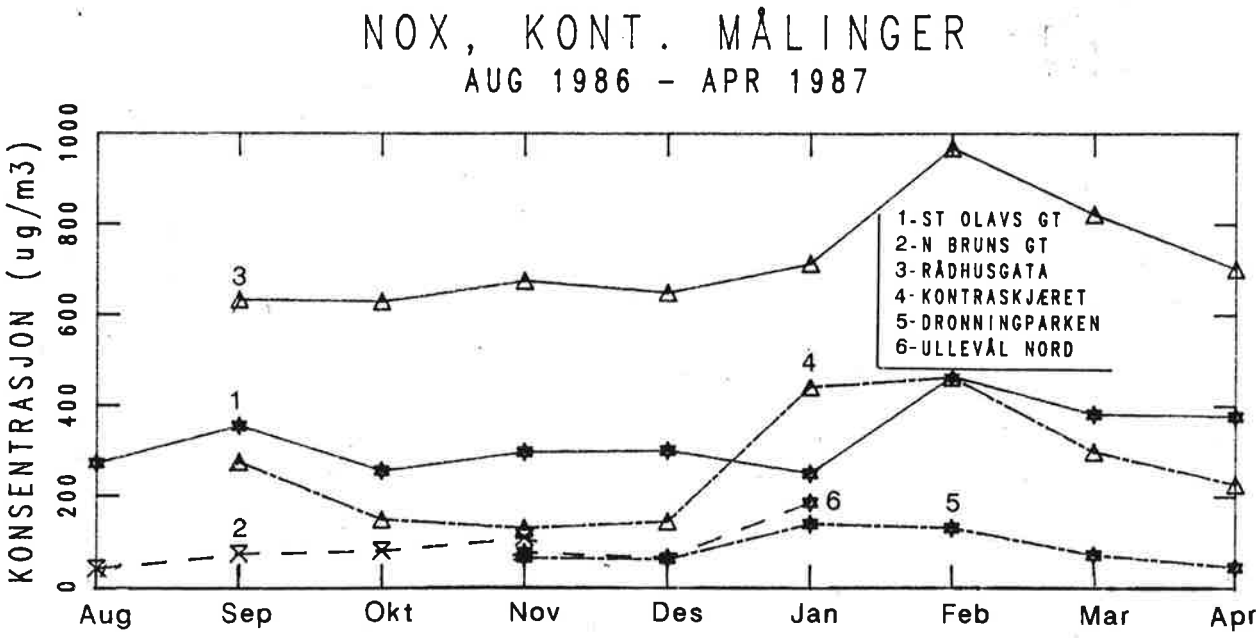
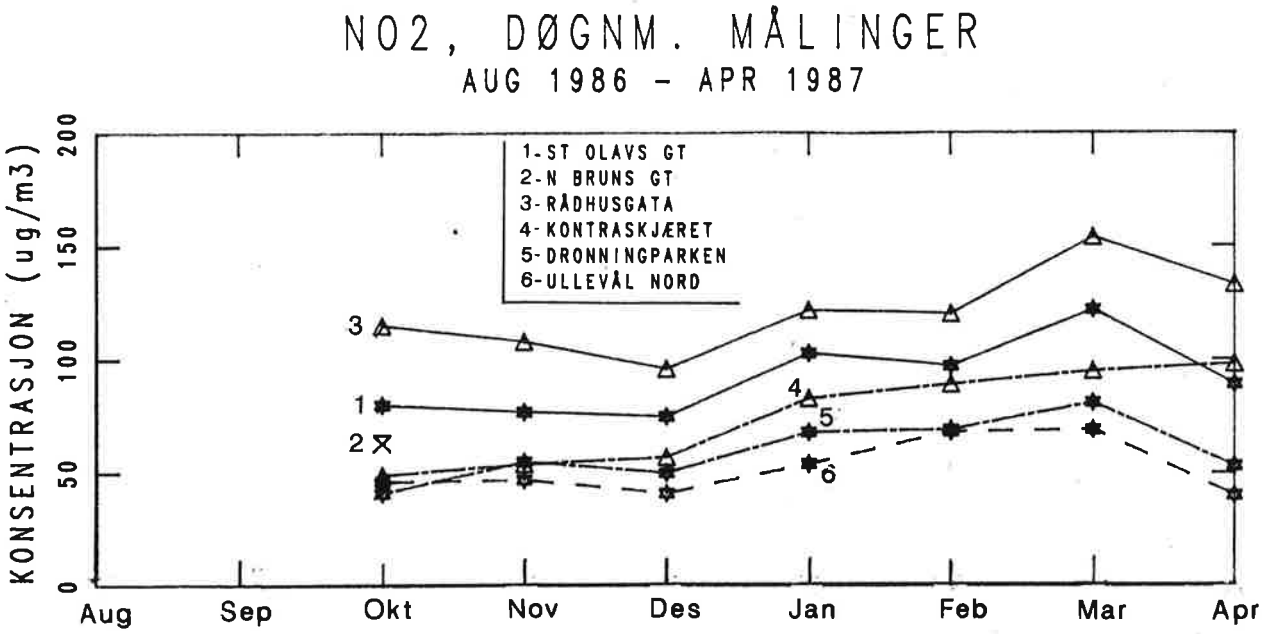
Figur 4 viser månedsmiddelverdier av NOx fra kontinuerlige målinger, og figur 5 viser månedsmiddelverdier av NO_2 fra døgnmidlete målinger.



Figur 4: NOx.
Månedsmiddelverdier fra kontinuerlige målinger.



Figur 5: NO_2.
Månedsmiddelverdier fra døgnmidlete målinger.

4.2 OKSIDASJONSGRAD (NO_2/NOx)

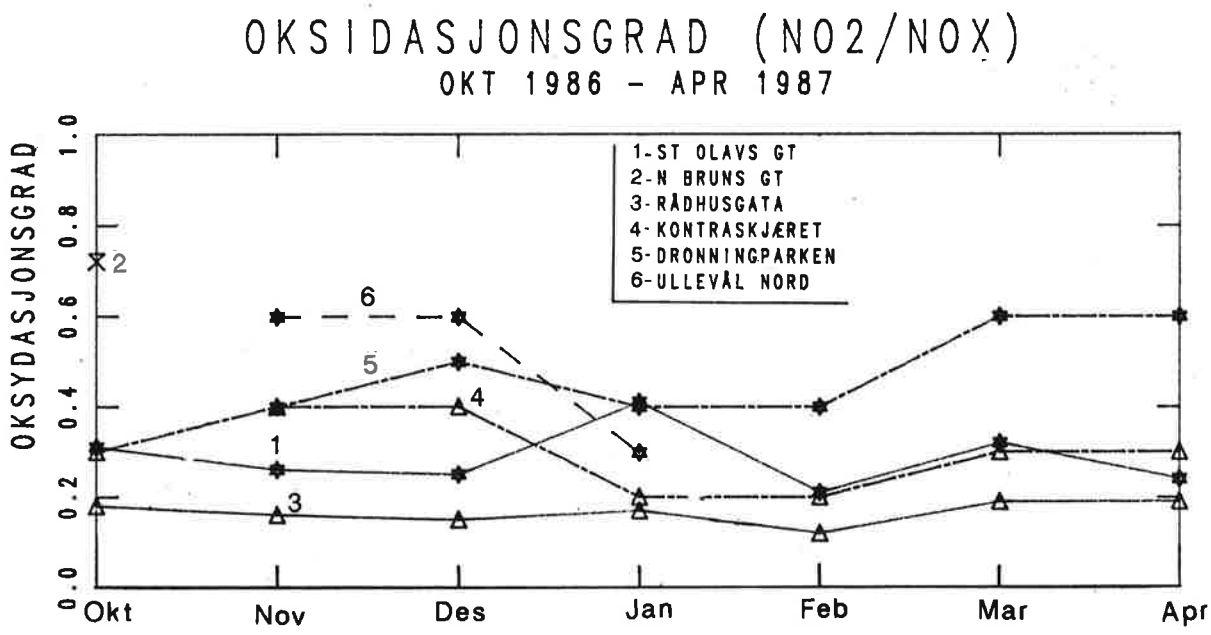
Oksidasjonsgraden er her et forholdstall som angir forholdet mellom mengden av nitrogendioksid og mengden av totalt nitrogenoksid i lufta. For de aktuelle målingene vil en trafikkbelastet gate med dårlig utlufting gi en lav oksidasjonsgrad. Mindre trafikk og bedre utlufting gir høyere oksidasjonsgrad. Måleresultatene stemmer overens med dette.

Tabell 3 viser middeltall for oksidasjonsgraden. Det er tatt med to oksidasjonstall for hver stasjon. I det ene tilfellet har vi brukt NO_2 fra de kontinuerlige målingene og i det andre tilfellet NO_2 fra de døgnmidlete målingene.

Tabell 3: Oksidasjonsgrad (NO_2/NOx). Middelverdier.

Stasjon	NO_2 fra kont. målinger	NO_2 fra døgnm. målinger
St. Olavs gt	0,23	0,29
Nordahl Bruns gt	0,54	0,72
Rådhusgata	0,17	0,16
Kontraskjæret	0,50	0,40
Dronningparken	0,50	0,80
Ullevål Nord	0,50	0,60

Figur 6 viser månedsmiddelverdier av oksidasjonsgraden fra alle de 6 målestasjonene. I forholdstallet NO_2/NOx har vi brukt NO_2 fra de døgnmidlete målingene og NOx fra de kontinuerlige målingene. For stasjon Dronningparken er både NOx og NO_2 fra de kontinuerlige målingene. Grunnen er at NOx-verdiene fra de kontinuerlige målingene i slutten av måleperioden er lavere enn NO_2-verdiene fra de døgnmidlete målingene. Dette gir en oksidasjonsgrad som er større enn 1,0.



Figur 6: Oksidasjonsgrad, NO_2/NOx.
NO_2 fra døgnmidlete målinger, unntatt Dronningparken.
NOx fra kontinuerlige målinger.

4.3 OVERSKRIDELSER AV GRENSEVERDIER

Overskridelser av grenseverdier for NO_2 på den enkelte målestasjon må ses i lys av datakvaliteten der. Ullevål Nord hadde 7 overskridelser av øvre grenseverdi (350 µg/m^3), men målingene viste sannsynligvis til dels for mye for høye verdier i området over 100 µg/m^3. Rådhusgata hadde ingen overskridelser av øvre grenseverdi, men der viste sannsynligvis målingene 25% for lave verdier. Kontraskjæret hadde 4 overskridelser av øvre grenseverdi, men der har sannsynligvis målinger over 100 µg/m^3 vist et noe for høyt nivå. I St. Olavs gt ble det målt CO over anbefalt grenseverdi (25 mg/m^3) 6 ganger, og O_3 over anbefalt nedre grenseverdi (100 µg/m^3) 19 ganger.

Statens forurensningstilsyn anbefaler følgende grenseverdier med midlingstid 1 time (SFT, 1982):

NO_2 : 200-350 µg/m^3
CO : 25 mg/m^3
O_3 : 100-200 µg/m^3

Tabell 4 viser antall overskridelser av anbefalte grenseverdier for de forskjellige stasjoner.

Tabell 4: Kontinuerlige målinger av luftkvalitet. Antall overskridelser av anbefalte grenseverdier i Oslo 1986-87.

Stasjon	NO_2 (200-300 µg/m^3) nedre	NO_2 (200-300 µg/m^3) øvre	CO (25 mg/m^3)	O_3 (100-200 µg/m^3) nedre	O_3 (100-200 µg/m^3) øvre
St. Olavs gt.	19	1*	6	19	0
Nordahl Bruns gt.	0		0	-	-
Rådhusgata	114	0	-	-	-
Kontraskjæret	162	4	-	-	-
Dronningparken	0		-	-	-
Ullevål Nord	44	7	-	-	-

* 865 µg/m^3, høyeste målte verdi for alle stasjoner i hele måleperioden.

4.4 DISKUSJON AV MÅLEMETODER

Vi regnet med at de døgnmidlete målingene av NO_2 var av en så god kvalitet at vi valgte å bruke dem som kvalitetskriterium for de kontinuerlige målingene av NO_2. Det synes etter dette klart at metoden som her er benyttet for å registrere kontinuerlige verdier av NO_2 ofte gir data av dårlig kvalitet.

Delrapportene for de enkelte stasjoner gir en nærmere beskrivelse av sammenligning mellom kontinuerlige og døgnmidlete NO_2-målinger, se referanselisten. Vi regner med at bruk av dataloggere i de kontinuerlig registrerende instrumentene vil føre til forbedring av denne formen for målinger. Det vil imidlertid fremdeles knyttes stor usikkerhet til målinger av NO_2 der konsentrasjonsnivået er lavere enn 25 µg NO_2/m^3. Den beste metoden for å begrense "drift" i instrumentet (dvs. gradvis endring av nullpunkt) er å øke inspeksjonshyppigheteten. Dette vil imidlertid øke kostnadene for denne typen målinger.

FORKLARING TIL UTSKRIFTEN

99.0 er manglende data.

Til slutt i hver måned er det tatt med hvor mye data som mangler i antall (ANT. 99.) og prosent (PROSENT 99.).

Enheter

NOx: $\mu g/m^3$
CO : mg/m^3
O_3 : $\mu g/m^3$

FORKLARING TIL UTSKRIFTEN

99.0 er manglende data.

Til slutt i hver måned er det tatt med hvor mye data som mangler i antall (ANT. 99.) og prosent (PROSENT 99.).

Enhet: $\mu g/m^3$.

Luftkvalitet | Trafikkforurensning

REFERAT (maks. 300 anslag, 7 linjer)
Denne rapporten er en statistisk bearbeidelse av resultater fra målinger av nitrogenoksider, karbonmonoksid og ozon fra 6 stasjoner i Oslo i perioden august 1986-april 1987. Målestasjonene ble opprettet i forbindelse med prosjektet "Metodeutvikling for undersøkelser av luftforurensninger i byer og tettsteder".

TITLE Method development for studies of air quality in cities and residental areas.

ABSTRACT (max. 300 characters, 7 lines)
