MONTHLY PRECIPITATION AND MEAN CONCENTRATION VALUES 1974	71

INTRODUCTION

In order to facilitate overviews of the measurement data, calculated means and precipitation are presented. These have been calculated from the final data for 1972 and 1973, while the 1974 data must still be regarded as preliminary.

Also, in general, the data have been reported from several laboratories, and there may be some inconsistencies in the results. Only a minimum of corrections in the reported data have been carried out by the CCU.

Jan Schaug

EXPLANATIONS OF THE INDIVIDUAL COLUMNS:

- MM(1) Amount of precipitation from the collected volume in the precipitation samples.
- MM(2) Amount of precipitation from precipitation gauge in the meteorological (official) precipitation measurement network (if available).
- H- PREC, NA - PREC, f.e. These are mean weighted concentrations of strong acid, sodium, magnesium, and sulphate concentrations, computed from the daily concentration and precipitation data.
- Multiplication with the amount of precipitation, MM(1) or MM(2), gives the deposition in μ equivalents/m² or mg/m².
- When the strong acid concentrations are not reported, they have been computed from the pH-values, when available.
- The concentrations of sulphate in precipitation have been corrected for sea-spray when sodium or magnesium concentration data are available.
- The air concentration data are simple arithmetic means of the daily values.
- 0.00 have been used to indicate that no data are available.
