METEOROLOGISKE DATA FRA NEDRE TELEMARK, VÅREN 1986

Kjell Skaug

NORSK INSTITUTT FOR LUFTFORSKNING
POSTBOKS 64, 2001 LILLESTRØM
NORGE

SAMMENDRAG

De meteorologiske målingene fra nedre Telemark i perioden 1.3.86-31.5.86 er presentert.

Vindretningsfordelingen for måleperioden likner på fordelingen for de siste fem års vårperioder. Det var noe flere observasjoner med vind fra sør og sørøst samt vindstille enn gjennomsnittet for de fem siste vårperiodene. Gjennomsnittlig vindstyrke på 2.9 m/s var som normalt.

Fordelingen av stabilitetsklassene avvek lite fra det som har vært vanlig de ni siste åra. Det var noen færre tilfeller av stabil og nøytral skiktning, og flere tilfeller av lett stabilt enn det som har vært vanlig tidligere. Antallet ustabile tilfeller var som normalt.

Temperaturavvikene fra det normale var ganske betydelige, spesielt i april som hadde den laveste gjennomsnittstemperaturen som er registrert siden målingene startet. Middeltemperaturen for mars var 0.3^{0}C høyere, april var 1.9^{0}C kaldere og mai var 0.5^{0}C kaldere enn gjennomsnittet for de ti siste åra.

INNHOLDSFORTEGNELSE

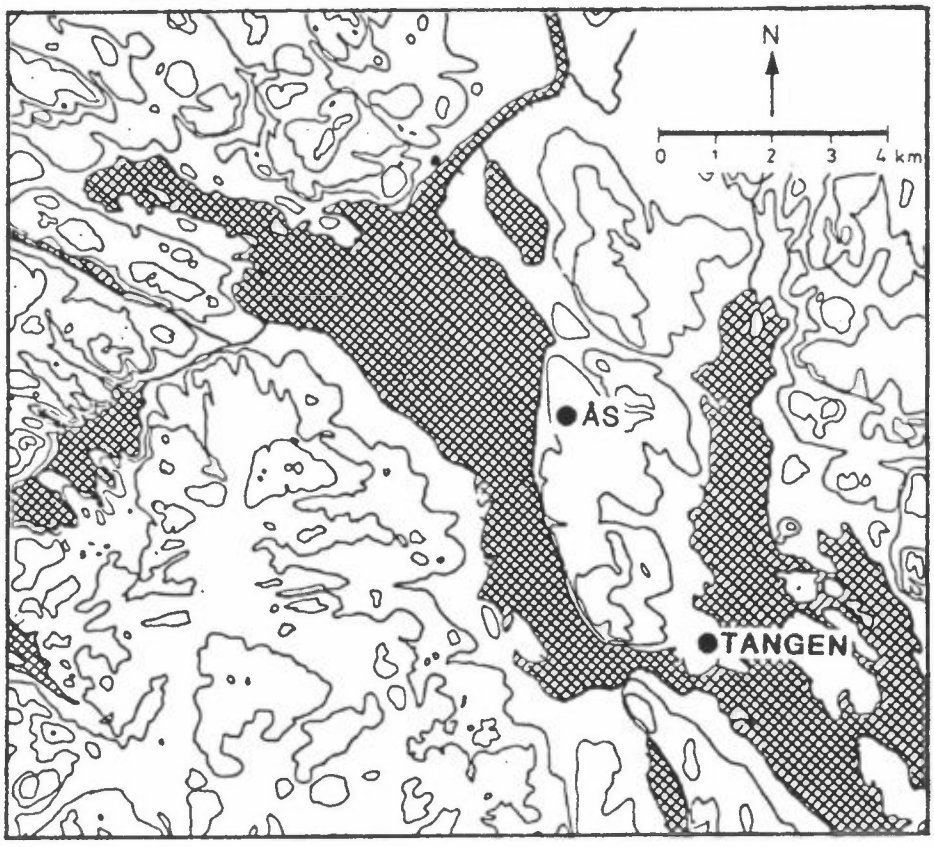
METEOROLOGISKE DATA FRA NEDRE TELEMARK VÅREN 1986

1 INNLEDNING

Denne presentasjonen av meteorologiske data fra nedre Telemark i perioden 1.3.86-31.5.86 (vår), er et ledd i det koordinerte måleprogram av meteorologi og spredningsforhold i området. Bearbeidelsen er utført på oppdrag fra Statens forurensningstilsyn, kontrollseksjonen nedre Telemark, og er en videreføring av tidligere tilsendte data (se referanselisten).

2 INSTRUMENTERING, STASJONSPLASSERING

Målestasjonens plassering er angitt i figur 1.



Figur 1: Lokalisering av den meteorologiske målestasjonen i nedre Telemark.

Følgende instrumentering av anvendt ved Ås:

NILU automatiske værstasjon (AWS) med 25 m høy mast og direkte oppringt samband. Det måles timevis: vindretning, vindstyrke og temperataur (i 25 m), temperatur og relativ fuktighet (i 2 m), stabilitet (temperaturforskjell mellom 25 m og 10 m). Værstasjonen måler også vindkast (gust) og turbulens (i 25 m). Stasjonen er plassert 90 m o.h.

3 DATATILGJENGELIGHET/KVALITET

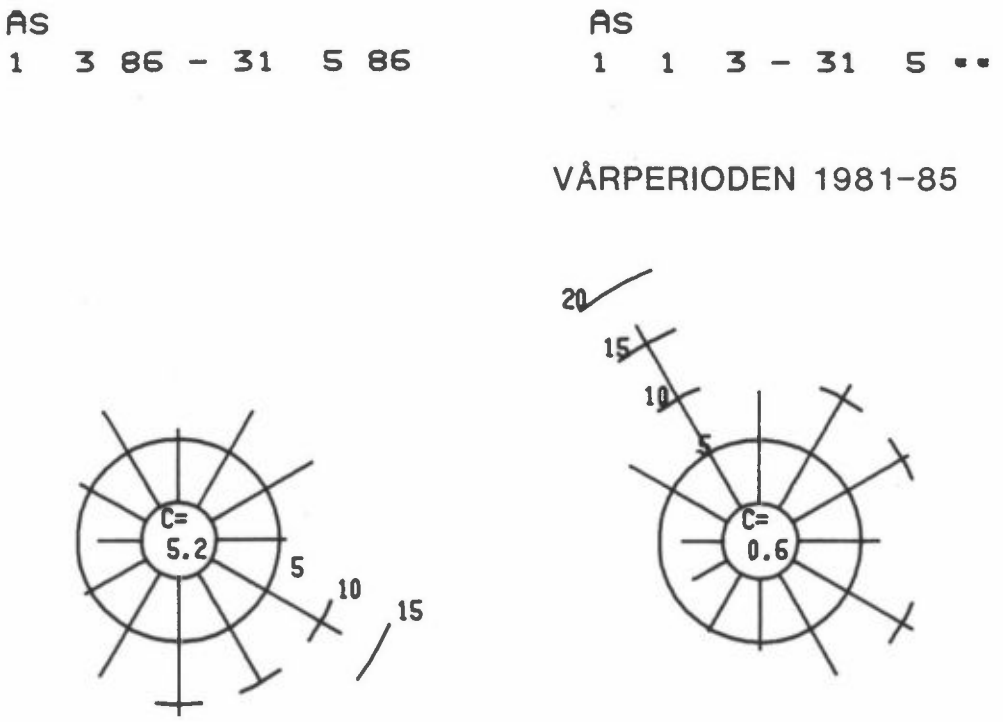
Datatilgjengeligheten fra AWS-stasjonen på Ås var også i denne perioden svært god.

Datatilgjengeligheten for perioden var følgende:

99.9% for temperatur (25 m og 2 m), temperaturdifferens, relativ fuktighet, vindretning (25 m og 2 m), vindhastighet (25 m og 2 m) 3 sek.-midl. gust, 1 sek.-midl. gust og horisontal turbulens.

4 VINDFORHOLDENE

Vindrose fra Ås for våren 1986 er vist i figur 2 sammen med rosen for de fem vårperiodene 1981-85.



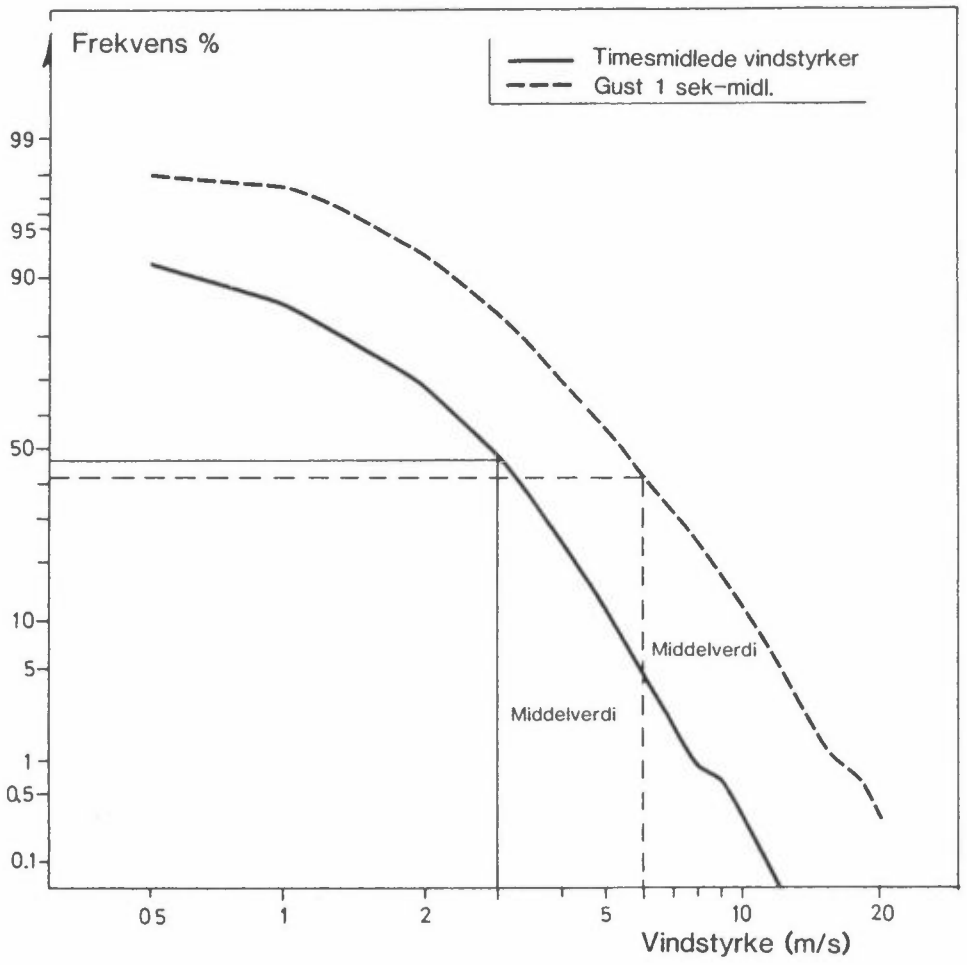
Figur 2: Vindroser (frekvens av vind i % i 12 sektorer) fra Ås for perioden 1.3.86-31.5.86, og for vårperiodene 1981-85.

Kvartalsvise vindfrekvensfordelinger (i %) er også presentert i tabellene A.1-2. Vindobservasjoner fra Ås er dessuten presentert som månedsvise frekvensfordelinger i tabell A.7.

Våren 1986 blåste det oftest fra sør og sørøst ved Ås. Dette tilsvarer godt vindretningsfordelingen for tidligere vårperioder, selv om overnevnte vindretninger forekom noe oftere enn vanlig. Vind fra nord-nordvest som tidligere vårperioder har vært den dominerende vindretningen, forekom sjeldnere enn vanlig. Det var også langt flere tilfeller av vindstille enn normalt. Dominerende vindretning ved Ås var i mars øst-sørøst, i april nord-nordøst og i mai øst-sørøst til sør.

Middelvindstyrken ved Ås var lik gjennomsnittet for vårperiodene 1981-85 og ble målt til 2.9 m/s. Gjennomsnittlige vindstyrker var for mars 2.8 m/s, april 2.9 m/s og mai 3.1 m/s. Den gjennonsnittelige vindstyrken for mars var lik femårsnormalen. April lå 0.1 m/s under, mens mai lå 0.2 m/s over gjennomsnittet for de fem siste åra.

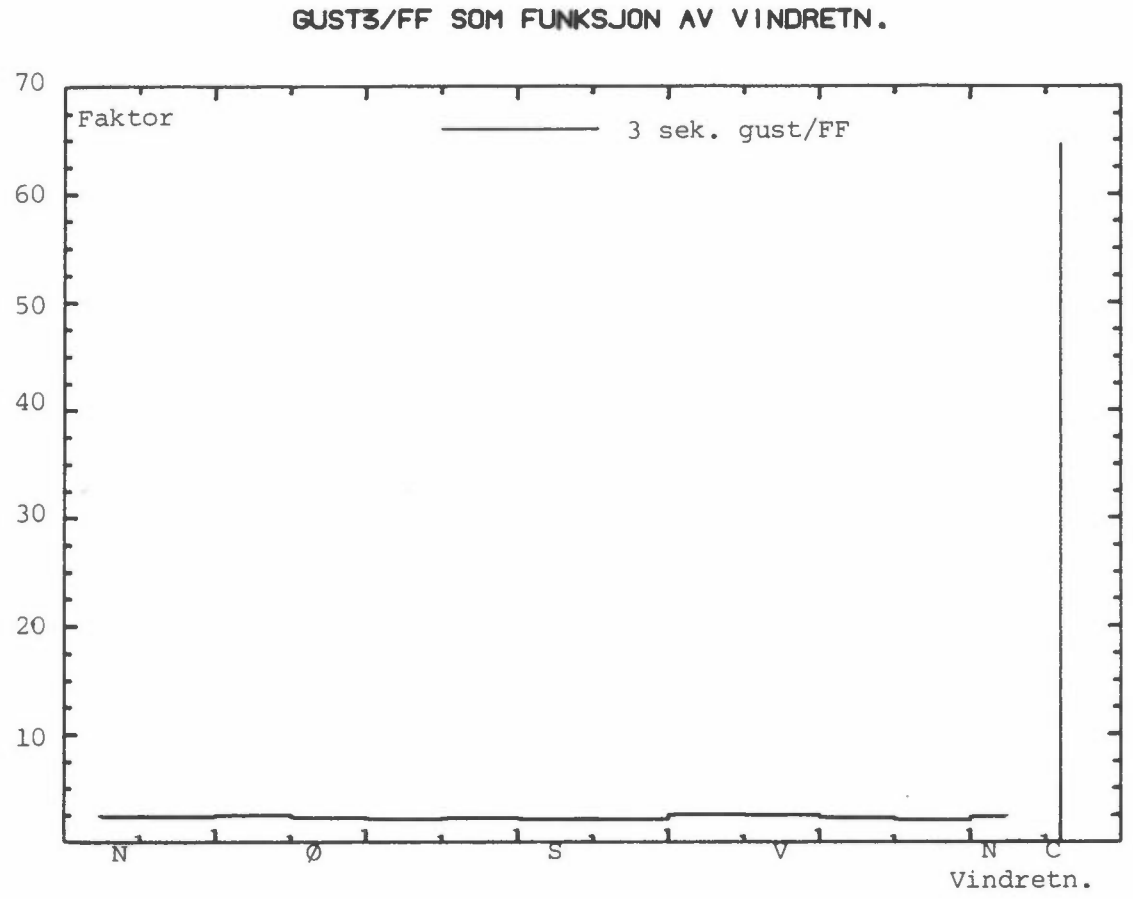
Figur 3 viser vindstyrkefordelingen ved Ås.



Figur 3: Kumulativ frekvensfordeling av vindstyrke og 1 sekunds gust ved Ås våren 1986. Figuren viser frekvens av vindstyrke større enn verdiene angitt på x-aksen.

Vindstyrker over 6 m/s ved Ås forekom i 4.8% av tiden. Svake vinder, mindre enn 2 m/s forekom i 31.3% av tiden. I gjennomsnitt blåste det svakest fra øst ved Ås. Kraftigst blåste det fra nord-nordøst.

Figur 4 viser forholdet mellom gust og timesmidlet vindstyrke ved forskjellige vindretninger. Forholdet varierer lite med vindretningen, og forholdet 3 sek.gust/FF ligger hele tiden nær en faktor 2. Det gjennomsnittlige forholdet er 2.3, og forholdet er størst ved vind fra vest-sørvest med 2.6. Ved vindstyrker lavere enn 0.2 m/s stiger imidlertid dette forholdet kraftig.

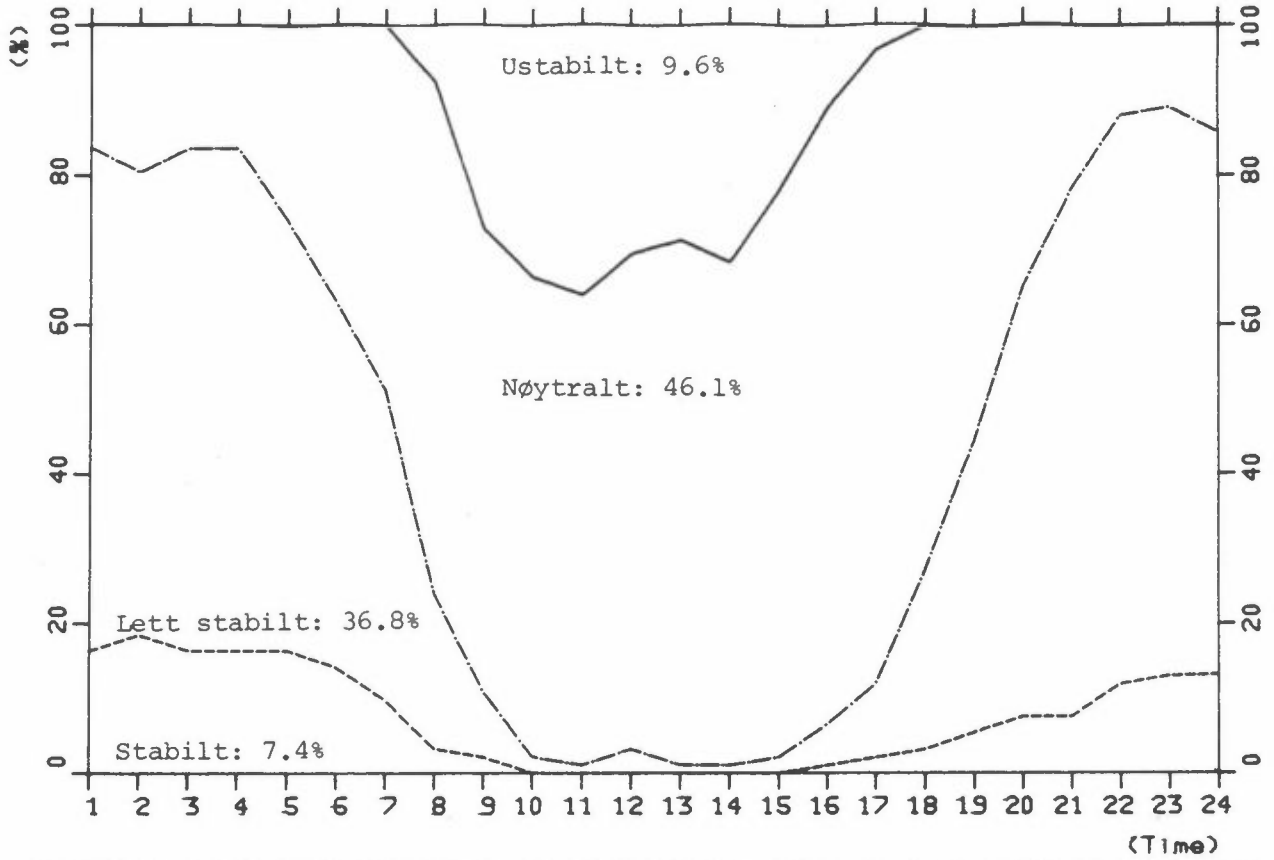


Figur 4: Forholdet mellom 3 sekunds gust og timesmidlet vindstyrke ved de ulike vindretningene. C symboliserer vind fra udefinert retning med hastighet < 0.2 m/s.

5 STABILITETSFORHOLDENE

Stabilitetsforholdene i fire klasser er fordelt over døgnet i tabell A.3 og A.8 og vist i figur 5, basert på temperaturdifferansen mellom 25 m og 10 m på Ås (dT). Stabilitetsklassene er definert ved:

Ustabilt	:	$dT < -0.5$
Nøytralt	:	$-0.5 \leq dT < 0$
Lett stabilt	:	$0 \leq dT < 0.5$
Stabilt	:	$dT \geq 0.5$



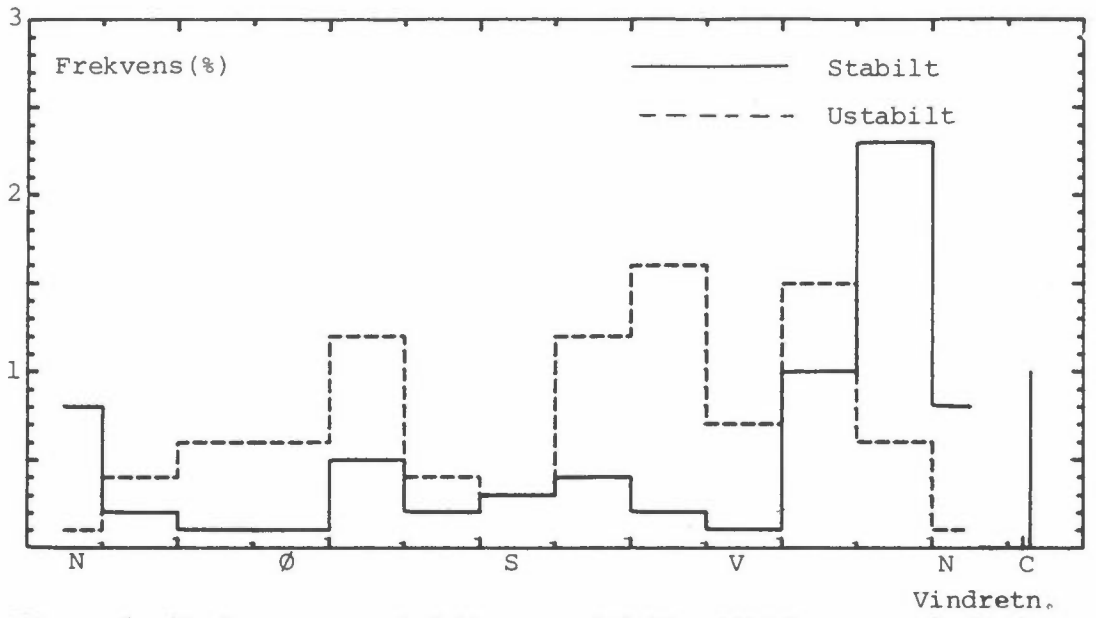
Figur 5: Døgnfordelingen av fire stabilitetsklasser basert på målinger av temperaturforskjellen mellom 25 m og 10 m i masten på Ås 1.3.86-31.5.86.

Våren 1986 var det 7.4% stabil, 36.8% lett stabil, 46.1% nøytral og 9.6% ustabil temperatursjiktning. Denne fordelingen er svært lik gjennomsnittet for de ni siste åra. Avviket var noen flere observasjoner av lett stabil sjiktning, og noen færre observasjoner av stabil- og nøytral sjiktning.

6 FREKVENS AV VIND/STABILITET

Tabell A.4 og A.9 gir frekvensen (i %) i 196 klasser av vind og stabilitet, basert på stabilitetsdata og vinddata fra 25 m masta på Ås.

Figur 6 viser frekvensen av stabil sjikting (inversjoner) og ustabil sjikt- ing som funksjon av vindretningen.



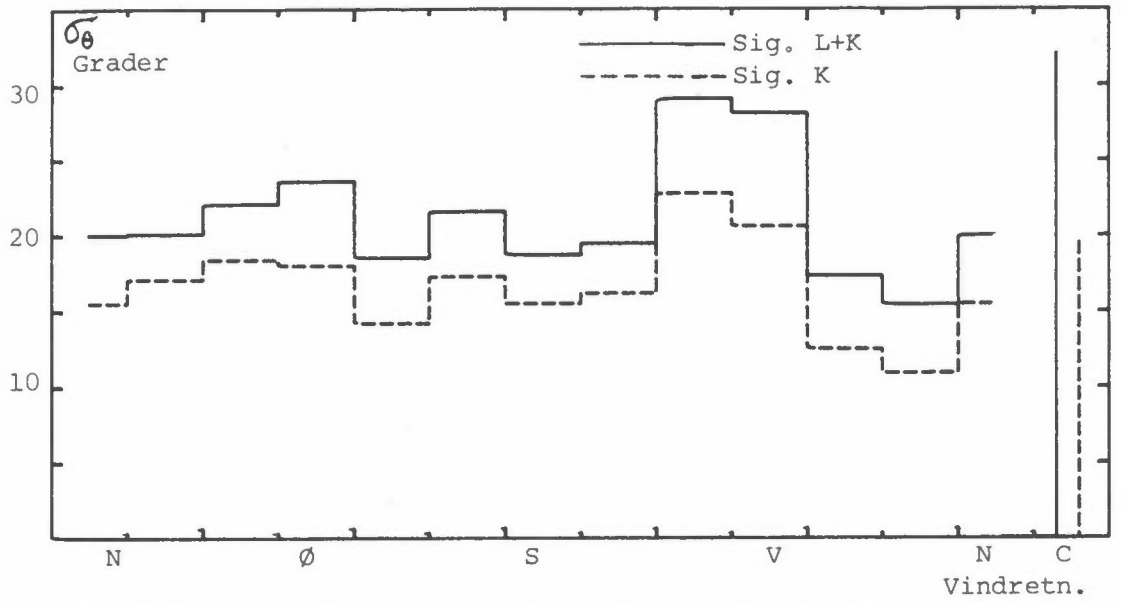
Figur 6: Frekvens av stabil og ustabil sjikting som funksjon av vindretningen ved Ås våren 1986.

Figur 6 viser at stabile tilfeller våren 1986 oftest forekom ved vind fra nord-nordvest. Tabell A.4 viser at vindstyrken da oftest var lavere enn 4 m/s. Dette representerer vanligvis de stabile nattsituasjonene. Flest ustabile situasjoner var det ved vind fra sørvest, og dette representerer soloppvarmingen om ettermiddagen.

7 HORISONTAL TURBULENS

Standardavviket av den horisontale vindretningsfluktasjonen σ_θ observert 25 m over bakken er et mål for den horisontale spredningen av luftforurensninger.

Midlere verdier av σ_θ er gitt i tabell A.10. Verdiene er gitt i klasser av vindretning og stabilitet. Figur 7 viser midlere verdier av σ_θ som funksjon av vindretningen. Sig.K. betyr $\sigma\theta$ midlet over 5 minutter mens sig.L+K. er et timesmiddel som i tillegg til sig.K. også tar inn de langperiodiske vind-meandreringene.



Figur 7: Midlere verdier av σ_θ (i grader som 5 minutters middel og timesmiddel) som funksjon av vindretningene.

Vi ser at σ_θ er høyest ved svake vinder av udefinert retning. Den er også høy ved vinder fra øst og vest.

8 TEMPERATUR

Tabell A.5 viser månedsvis temperaturstatistikk for Ås i perioden 1.3.86- 31.5.86.

Middeltemperaturen for mars var ved Ås 0.5°C, april 2.6°C og for mai 10.2°C. Gjennomsnittstemperaturen for mars var 0.3°C høyere enn gjennomsnittet for de ti siste åra. 1986 hadde den kaldeste april måned siden målingene startet med 1.9°C under normalen. Mai var 0.5°C lavere enn normalen. Den høyeste temperaturen ble målt den 7.5.86 kl 1300 til 19.9°C. Den laveste temperaturen ble målt den 1.3.86 kl 0700 til -11.2 C.

9 RELATIV FUKTIGHET VED ÅS

Tabell A.6 viser en statistisk fordeling av den relative fuktigheten ved Ås for våren 1986. Månedsmiddelverdiene viser relativ fuktighet på 86% i mars, 70% i april og 80% i mai. Den relative fuktigheten i mars og mai var høyere enn gjennomsnittet for de ti siste åra, mens april var svært lik normalen. I mars varierte fuktigheten i gjennomsnitt fra 80% midt på dagen til 90% om natten. I april varierte den fra 63% til 77%, og i mai fra 73% om ettermiddagen til 88% sent på natta.

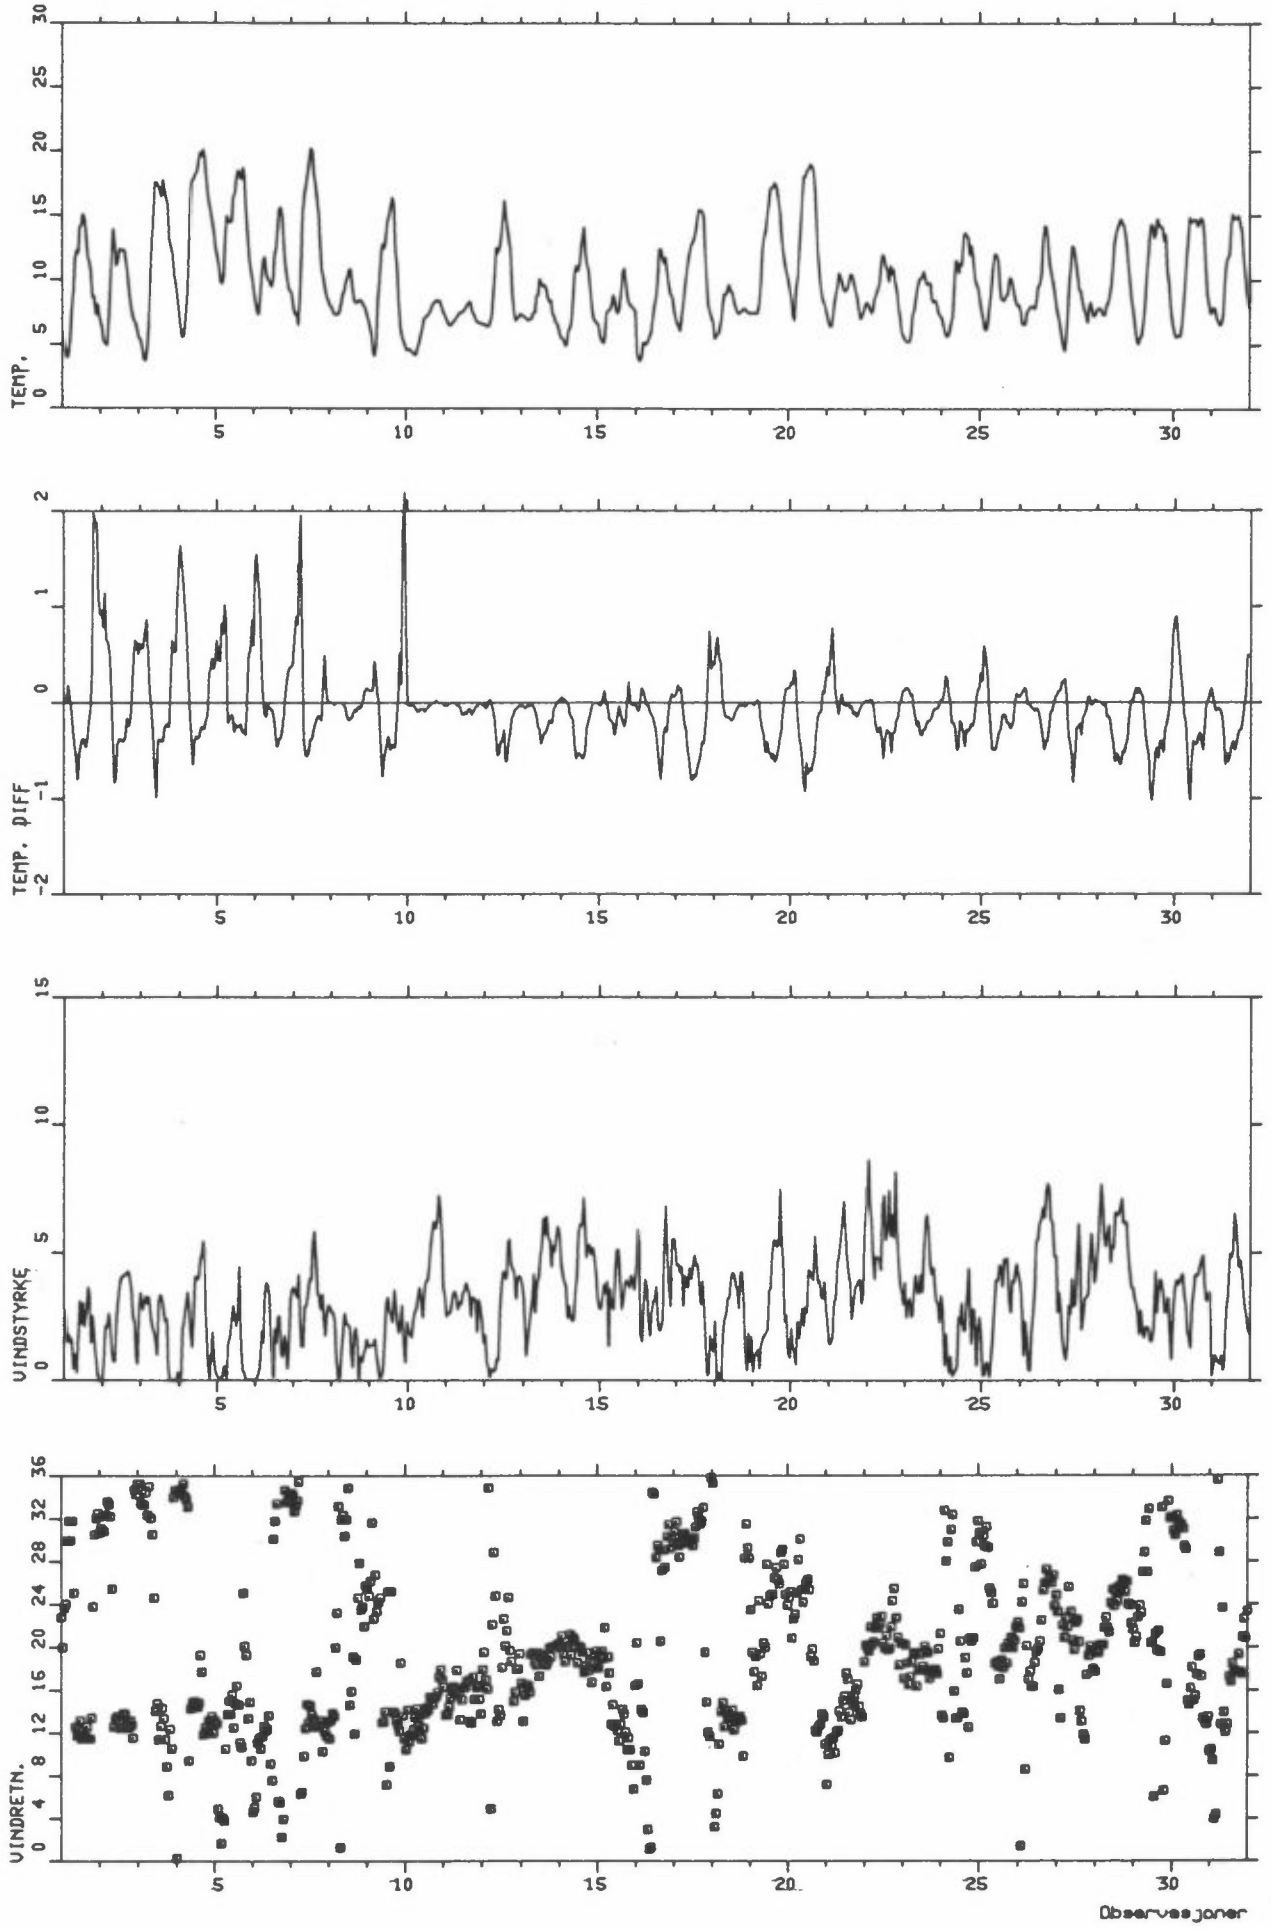
VEDLEGG B

Grafisk framstilling av tidsforløpet av:

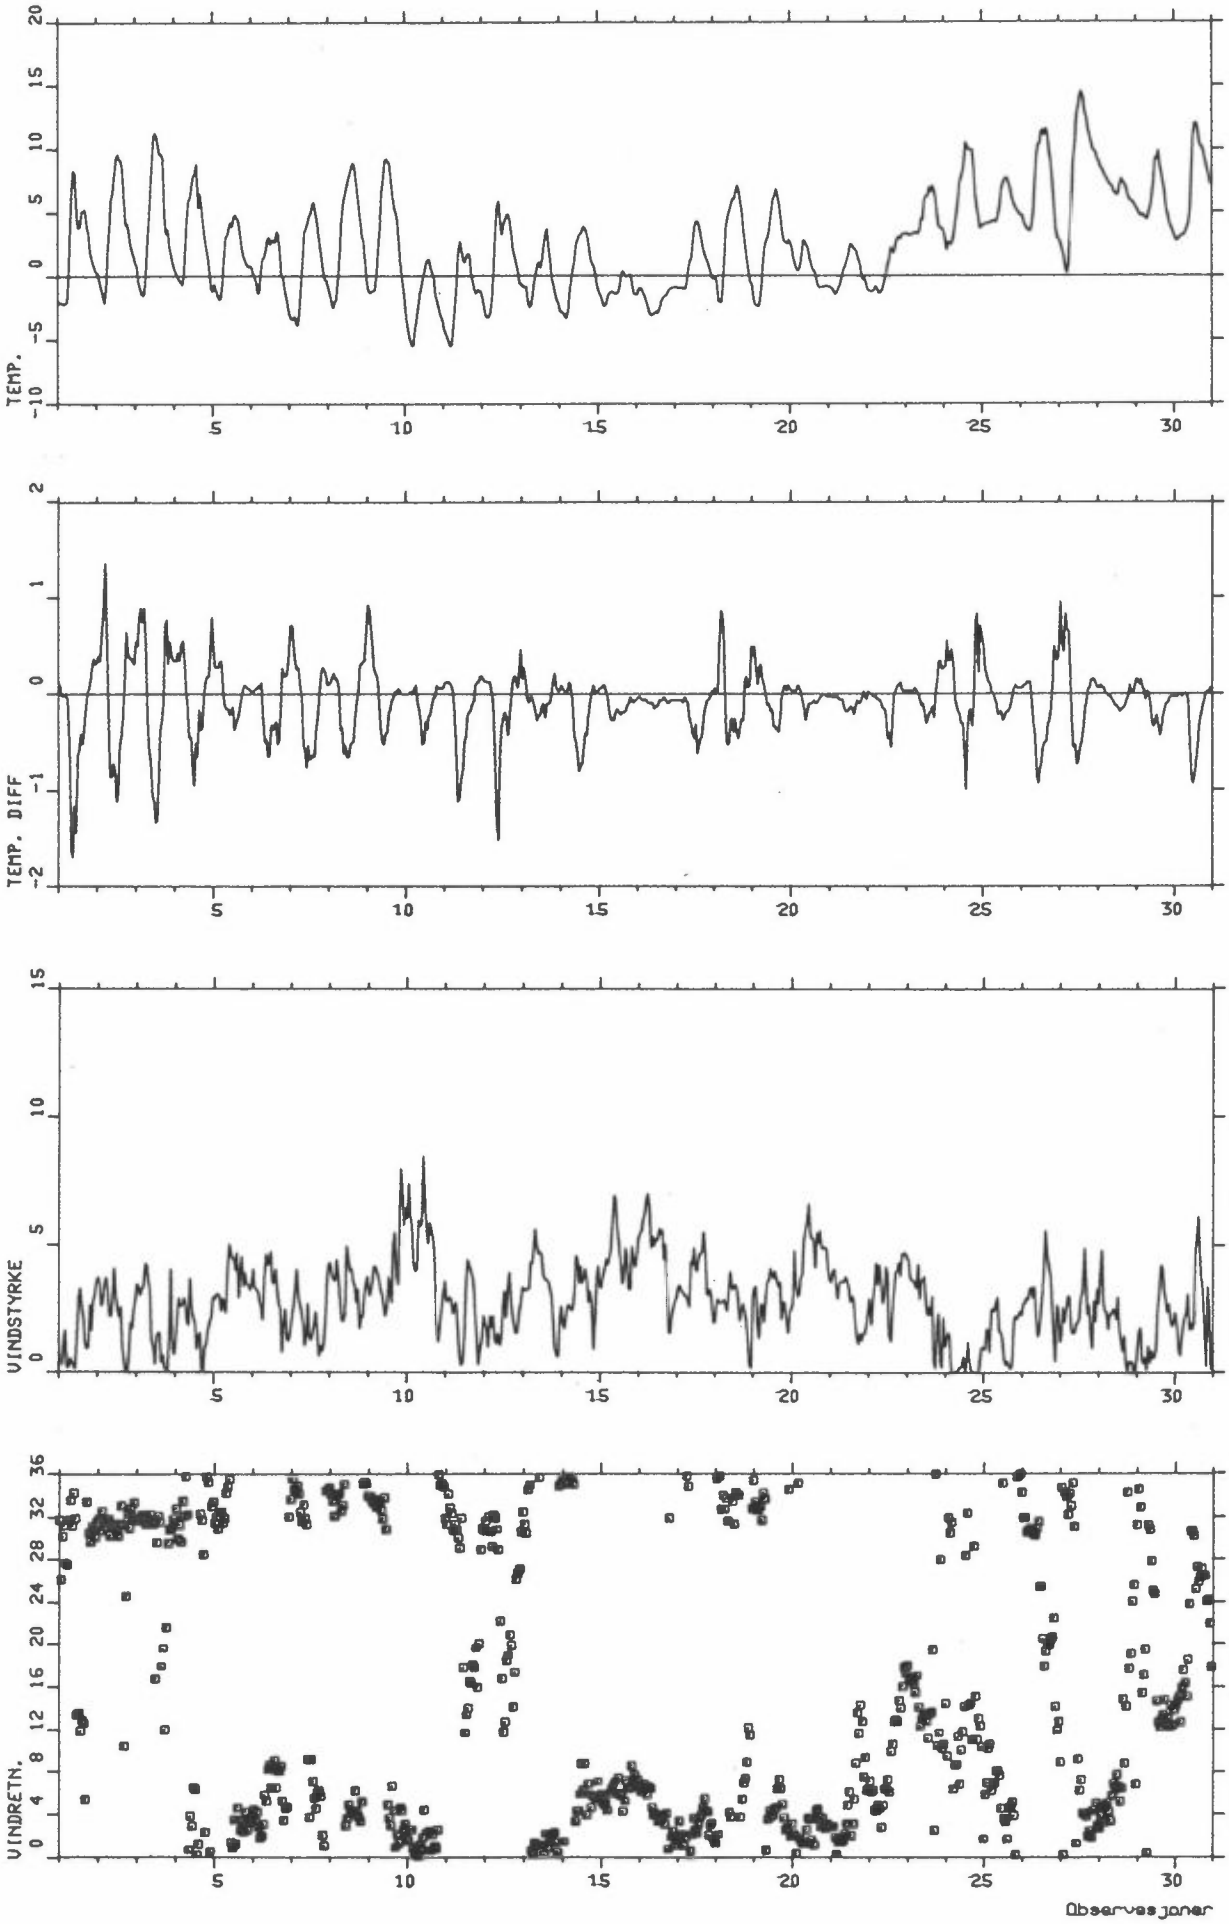
Tempertur	(^{0}C)
Temperaturdifferens	(25-10 m)
Vindhastighet	(m/s)
Vindretning	(Dekagrader)

for månedene mars, april og mai 1986 ved Ås.

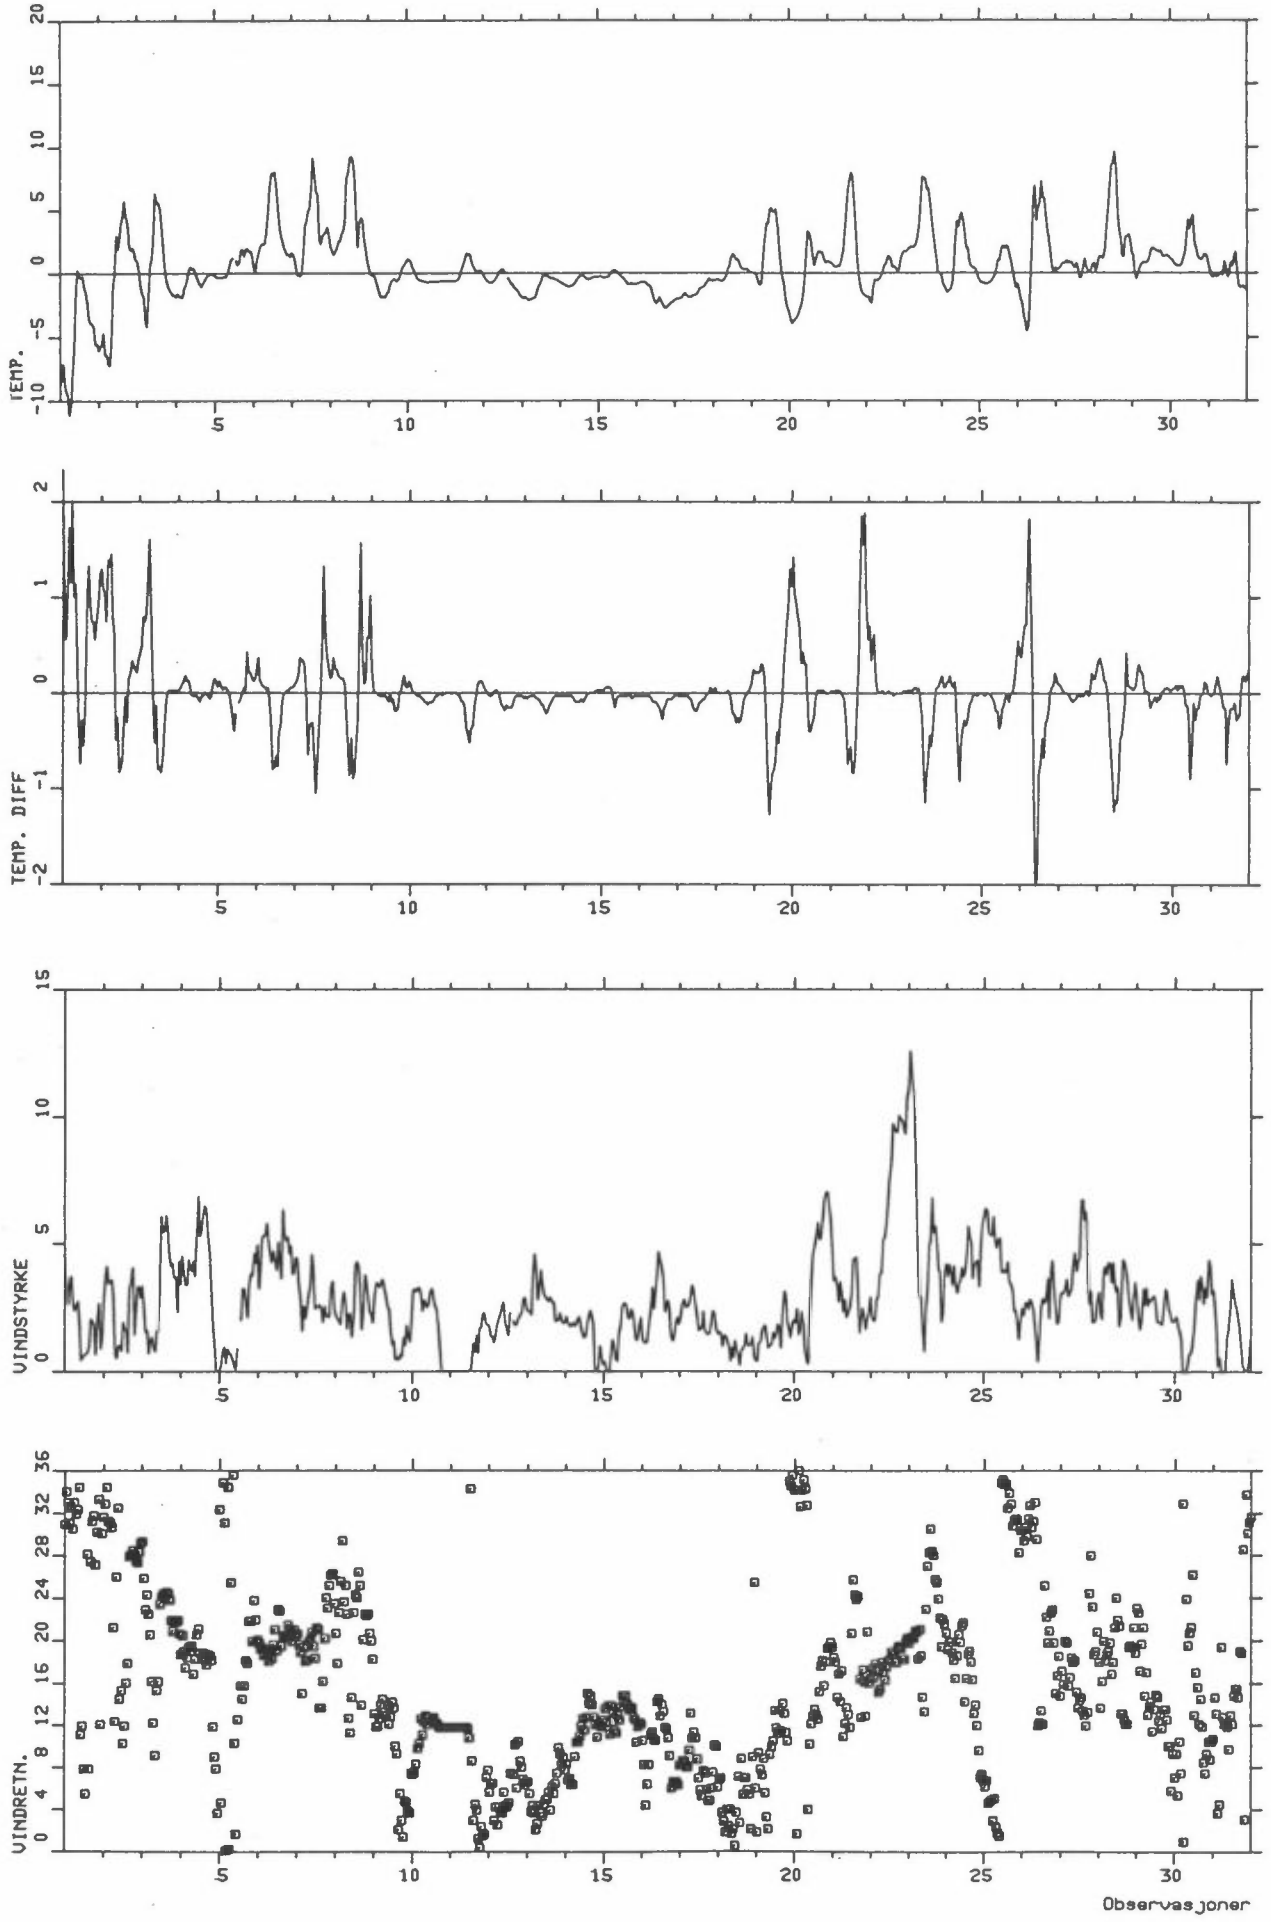
Stasjon: AS
Maned : MAI. 1986



Stasjon: AS
Maned : APR. 1986



Stasjon: AS
Maned : MAR. 1986



VEDLEGG C

Liste over timevise data fra nedre Telemark
1.3.86-31.5.86

FØLGENDE PARAMETRE ER GITT I DEN SYNOPTISKE LISTEN AV DATA

1. D25ÅS = vindretning (grader; 90= vind fra øst, 180= vind fra sør, osv.)
2. F25ÅS = vindstyrke (m/s 25 m over bakken ved Ås
3. GUST1 = høyeste 1 sek.-midl. vindhastighet 25 m over bakken ved Ås
4. GUST3 = høyeste 3 sek.-midl. vindhastighet 25 m over bakken ved Ås
5. SIGK = standardavvik i vindretningsfluktasjoner (σ_θ) midlet over 5 min. (grader)
6. SIGKL = timesmiddel av σ_θ (grader)
7. T25ÅS = lufttemperatur (^{0}C) 25 m over bakken ved Ås
8. T-2ÅS = lufttemperatur (^{0}C) 2 m over bakken ved Ås
9. D-ÅS = temperaturforskjell (^{0}C) 25-10 m ved Ås
10. RH-ÅS = relativ fuktighet (%) 3 m over bakken ved Ås

Observasjon 99 betegner manglende data. Tallet 10 eller 20 foran vindretningsangivelsen ved Ås angir at kvaliteten av middelvindretningen over 1 time er dårlig. (20-data anvendes ikke i de statistiske bearbeidelsene).

Meteorologiske data | Statistisk bearb.

REFERAT En statistisk bearbeiding av meteorologiske data fra nedre Telemark i perioden 1.3.86-31.5.86. viser dominerende sørøstlige vinder ved Ås. Gjennomsnittlig vindstyrke var lik normalen. Stabilitetsfordelingen ligger også nær gjennomsnittet for de ti siste åra. April og mai var kaldere enn gjennomsnittet for de ti siste åra, mens mars var noe varmere.

TITLE
Meteorological data from nedre Telemark, spring 1986.

ABSTRACT (max. 300 characters, 7 lines)
A statistical evaluation of meteorological data from nedre Telemark during the spring 1986 show dominating winds from southeast. Stable and light stable cases were observed in about 44% of the time. April and May were colder than normal, while March were warmer.
