METEOROLOGISKE DATA FRA OSLOFJORD-OMRADET 1971-74

STATISTISKE TABELLER

1 INNLEDNING

Dette notatet inneholder en statistisk bearbeidelse av meteorologiske data fra Oslofjord-området for perioden 1971-74. Dataene ble samlet i forbindelse med undersøkelser av spredningsforholdene ved alternative byggesteder for kjerne- kraftverk i Oslofjord-området. Målingene ble utført på oppdrag fra NVE Statskraftverkene, og dataene har tidligere vært brukt i flere rapporter (1,2,3,4,5).

2 STASJONSPLASSERING OG INSTRUMENTERING

Kartet i figur 1 viser plasseringen av stasjonene ved Oslofjorden.

Følgende instrumentering har vært anvendt:

- 1. Brenntangen : NILU automatisk værstasjon (AWS) med m mast, 95 moh. Registrerer:
 - Vindretning (DD) og vindstyrke (FF) i 25 m
 - Temperatur (T) i 2 m
 - Temperaturdifferans (ΔT_{25-10}) mellom 25 og 10 m

- 2. Sonsåsen :
 - Vindskriver, type Lambrecht nach Woelfle, på 10 m mast 114 moh. (DD, FF)

Figur 1: Meteorologiske stasjoner.

1. Brenntangen
2. Sonsåsen (Temp.diff. Sonsås-Laksa)
3. Li
4. Evjesundet
5. Hurum (Skjøttelvik)
6. Mørk

Observasjoner: V = vind
T = temperatur
 ΔT = temperaturdifferans
(stabilitet)

- Termograf, type Fuess for måling av temperatur (T) 2 m over bakken, 114 moh.
- Termograf, type Fuess (T) 2 m over bakken, 8 moh ved Laksa (500 m sørøst for Sonsåsen)

- 3. Li : Vindskriver, type Lambrecht nach Woelfle på 10 m mast, 25 moh (DD, FF)

- 4. Evjesundet : Vindskriver, type Lambrecht nach Woelfle, på 10 m mast, 15 moh (DD, FF)

- 5. Hurum : Vindskriver, type Lambrecht nach Woelfle på 10 m mast, 10 moh (DD, FF)
(Skjøttelvik)

- Termograf, type Fuess, (T) 2 m over bakken bakken 10 moh.

- 6. Mørk : Vindskriver, type Lambrecht nach Woelfle på 10 m mast, 15 moh (DD, FF).

3 DATAPERIODER

Figur 2 viser måleperiodene ved de forskjellige stasjonene.

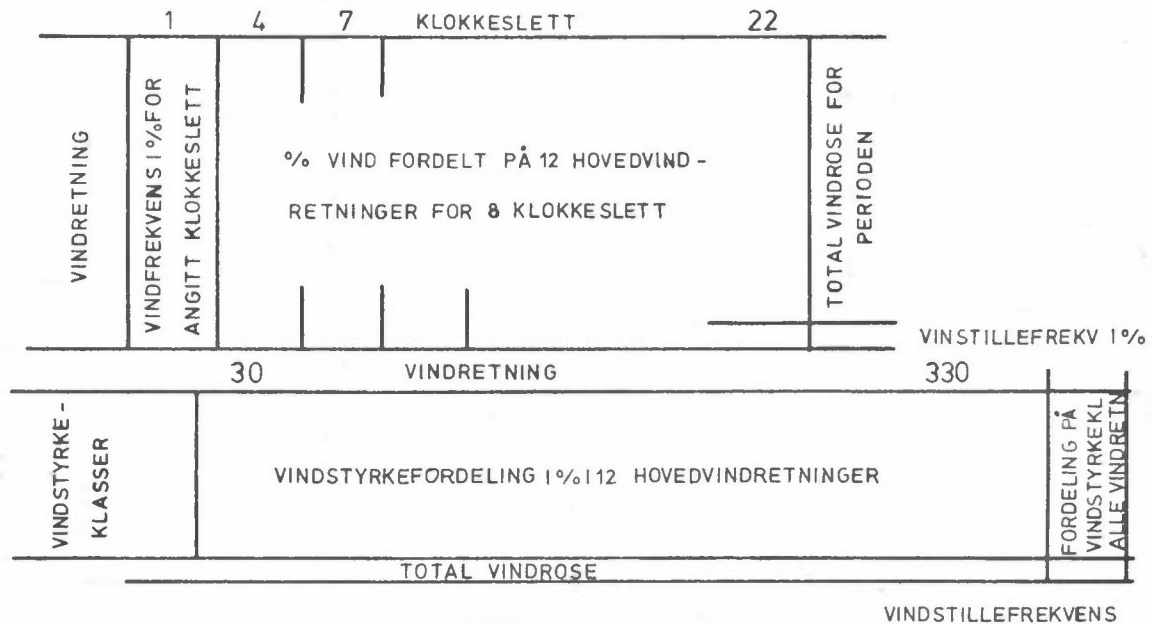

| Stasjon | Instrument | 1971 | 1972 | 1973 | 1974 |
|-------------|----------------|-------------|-------------|------|------|
| Brenntangen | AWS | ----- ----- | | | |
| Sonsåsen | Woelfle | ----- ----- | | | |
| (Laksa) | T.graf 114 moh | ----- ----- | | | |
| | - " - 8 moh | ----- ----- | | | |
| Li | Woelfle | | ----- ----- | | |
| Evjesundet | Woelfle | | ----- | | |
| Hurum | Woelfle | ----- | | | |
| | Termograf | ----- | | | |
| Mørk | Woelfle | | ----- | | |

Figur 2: Måleperioder for NILUs meteorologiske stasjoner ved Oslofjorden 1971-74.

Ved Brenntangen ble det i første del av måleperioden anvendt en vindskriver type Woelfle. Ved den automatiske værstasjonen (AWS) ble dataene samlet direkte på magnetbånd. Ved de øvrige stasjonene ble dataene registrert kontinuerlig på skrivere, avlest manuelt som timesverdier (hver time), punchet og lagret på magnetbånd ved NILU.

4 VINDFREKVENSER (Vedlegg A)

Vindfrekvensene er gitt i Vedlegg A i tabeller av typen skissert på figur 3.

Figur 3: Forklaring av tabeller vist i vedlegg A.

Vindretningssektorene er gitt i grader, dvs 90, 180, 270 og 360 svarer til at vinden kommer fra henholdsvis øst, sør, vest og nord. I øvre halvdel av tabellene er vindobservasjonene for hver 3. time fordelt på 12 hovedvindretninger, dvs. på 30°-sektorer. I kolonnen til høyre er gitt midlere vindfordeling for de 8 klokkeslettene.

I nedre del av tabellene finner en vindstyrkefordelingene for de 12 hovedvindretningene. Vindretningene er her gitt ved middelverdien for sektoren, dvs sektoren 20° - 40° er gitt ved 30°, osv. For hver sektor er også midlere vindhastighet angitt.

Vindfordelingene er gitt for hver årstid, dvs for 3 måneders perioder. Inndelingen er følgende:

Vinter : desember, januar og februar
Vår : mars, april og mai
Sommer : juni, juli og august
Høst : september, oktober og november

5 FREKVENNS AV VERTIKALE TEMPERATURFORSKJELLER,
STABILITET (Vedlegg B)

Frekvensen (%) i fire klasser av temperaturdifferansen mellom to nivåer (25-10 m i mast ved Brenntangen, eller mellom 114 moh og 8 moh ved Sonsåsen) er gitt for hver time og midlet over døgnet i vedlegg B. De fire klassene svarer til en ustabil atmosfære, nær nøytral sjikting, lett stabile og stabile forhold (inversjon).

6 SAMMENHENG VIND OG TERMISK STABILITET (Vedlegg C)

De timevise vindobservasjonene er fordelt på 12 hovedvindretninger, og for hver av disse 12 gruppene er det fire grupper av vindhastigheten, nemlig:

1. $FF < 2.0 \text{ m/s}$
2. $2.0 \text{ m/s} \leq FF < 4.0 \text{ m/s}$
3. $4.0 \text{ m/s} \leq FF < 6.0 \text{ m/s}$
4. $FF \geq 6.0 \text{ m/s}$

For hver av de fire hastighetsgruppene er observasjonene delt i fire spredningsgrupper (målt ved den vertikale temperaturforskjell mellom to stasjoner).

Inndelingen av stabilitetsklassene er som følger:

| | AWS (ΔT_{25-10m}) | $T_{\text{Sonsåsen}} - T_{\text{Laksa}}$ |
|-------------|-----------------------------|--|
| Instabil | < - 0.8 | < - 1.5 |
| Nøytral | - 0.8 til 0 | - 1.5 til 0 |
| Lett stabil | 0 til 0.8 | 0 til 1.0 |
| Stabil | > 0.8 | > 1.0 |

Enhet: grader

Disse tabellene danner utgangspunkt for beregning av årstids-
middelkonsentrasjoner og årsbelastninger for gitte utslipps-
betingelser ved et planlagt utslipp av luftforurensninger.

7 TEMPERATURSTATISTIKK (Vedlegg D)

Månedlige middeltemperaturer, maksima, minima og antall dager
og timer med temperatur under -10 , 0 og 10°C er presentert i
vedlegg D. Dessuten er middeltemperatur hver 3. time, med
standardavvik og antall observasjoner presentert månedsvis.

8 BETINGET VINDFREKVENS (Vedlegg E)

For å se sammenhengen mellom samtidige vindobservasjoner på
to stasjoner, er det beregnet såkalte betingete vindfrekvenser.
I tabellene er de mulige vindretningene for de to stasjonene
gitt horisontalt og vertikalt, og i hver "rute" er gitt antall
samtidige observasjoner som hører til "ruten". Hvis de to
stasjonene har identiske vindretningsobservasjoner, vil samtlige
observasjoner være fordelt på "rutene" langs tabellens diagonal.
Systematiske avvik fra diagonalen viser forskjell i vindforholdene
ved de to stasjonene.
